BID Trust

BUSINESS IDENTITY & DUE DILIGENCE

Trust, backed by verification.

An industry-agnostic trust, verification and due-diligence infrastructure for modern business relationships.

bidtrust.in | Seed round | India-first, category-neutral

THE BIG IDEA

Every company answers the same question, over and over, about a different counterparty.

> **"Can I trust this business or person enough to work with them?"**

The counterparty changes

Supplier, contractor, candidate, distributor, consultant, partner, service provider.

The work does not

Collect documents, chase the counterparty, verify, judge, file the evidence, repeat in twelve months.

Nobody owns the record

Verification produces a decision, not a defensible, sourced, timestamped record.

It goes stale immediately

A vendor verified in January can be struck off by March. Almost nobody re-checks.

BID connects identity + relationships + verification + evidence + assessment + credentials + monitoring into one trust layer — so that question gets answered once, properly, and stays answered.

THE PROBLEM

Trusting a third party is still a fragmented process.

WHAT COMPANIES DO TODAY

Supplier documents · Email threads · Excel trackers · Manual review · Agency A · Agency B · KYB API · BGV vendor · HRMS · Procurement suite · Shared drive · Periodic checks · Audit scramble

Thirteen tools and no system of record. When an auditor asks how a supplier was verified in 2024, somebody searches an inbox.

Consequences

Slow onboarding
Weeks per counterparty

Duplicate verification
Same supplier, twenty buyers

Inconsistent standards
Depth varies by who did it

No visibility
Which vendors are still valid?

Stale verification
Point-in-time, never refreshed

Compliance exposure
Decisions you cannot evidence

The most telling question to ask a prospect: “What percentage of your vendor base has been re-verified in the last twelve months?” Most organisations genuinely do not know. That moment is where the deal starts.

THE SOLUTION

One trust layer for every business relationship.

Eight primitives, one platform. Every business relationship in any industry is expressible as a combination of these.

Organization The primary entity. Not a “vendor”, not a “customer” — an organization.	**Person** Employee, candidate, contractor worker, director — consent-gated throughout.	**Relationship** Carries the purpose. Purpose is what makes data collection lawful and proportionate.	**Policy** What “verified” means for this relationship. Configurable, versioned, immutable.
Verification Executed through authorized providers. Orchestrated, not owned.	**Evidence** Immutable, hashed, classified at capture. What survives an audit.	**Assessment** Deterministic and explainable. Never an opaque score.	**Credential + Monitoring** Reusable, expiring, continuously watched. Trust that stays true.

The same eight primitives serve a pharma supplier, a site contractor and a candidate. **Only the policy changes.**

THE MOST IMPORTANT SLIDE IN THIS DECK

BID does not replace verification providers. BID is the layer above them.

Enterprise

↓

BID Trust

↓

Policy | Orchestration

↓

Existing verification providers

↓

Evidence | Assessment

↓

Enterprise decision

↓

Continuous monitoring

Provider-neutral trust orchestration

Specialist providers keep doing what they are good at. BID routes to them, normalizes what comes back, stores the evidence and keeps the record alive.

CATEGORIES BID CAN ORCHESTRATE

KYB · BGV · Identity · GST data · MCA-derived data · Bank verification · Education · Employment · Address · Risk / AML · Document verification

Why this matters commercially: it converts the largest incumbents from competitors into suppliers — and, plausibly, into channel partners.

No company is claimed as a BID partner. Categories shown are illustrative of what the orchestration layer is designed to route to.

HOW IT WORKS

Twelve steps, one platform.

Written for a non-technical reader. Everything from “who is this?” to “is it still true?”.

01 **Identify** → 02 **Define relationship** → 03 **Select policy** → 04 **Request verification** → 05 **Obtain consent** → 06 **Orchestrate**

07 **Normalize results** → 08 **Store evidence** → 09 **Assess** → 10 **Issue credentials** → 11 **Monitor** → 12 **Audit**

Steps 1–3 are the product

Most competitors start at step 6. Identity, relationship and policy are where the defensibility lives.

Steps 5 and 8 are the licence to operate

Consent and evidence are what make this defensible to a regulator, an auditor and a court.

Steps 11–12 are the business model

Monitoring and audit convert a one-time transaction into recurring revenue.

THE ARCHITECTURAL INSIGHT

Organizations are not permanently vendors, customers or suppliers.

Roles are relationships, not entity types. This one decision is what makes BID domain-agnostic — and what makes verification reusable.

XYZ HR Consultants

BID-BUS-00231 · one record

Vendor to ABC Technologies	**Customer** of LMN Components
Supplier to OPQ Logistics	**Employer** of Ravi Kumar
Verification requester of its own network	**BID customer** paying subscriber

The mistake most platforms make

Modelling “vendor” and “customer” as entity types. The same company then exists as three records, reuse becomes impossible, and the network effect can never be built.

What this unlocks

- One company, one record, regardless of how many parties transact with it
- The same vendor can be “Standard” for one buyer and “Critical” for another, with no conflict
- A verified subject today can be a paying requester tomorrow — with no migration
- Purpose limitation becomes technically enforceable, because purpose lives on the relationship

DOMAIN-AGNOSTIC BY ARCHITECTURE

Core engine + configurable policy = industry workflow.

CORE BID ENGINE

Identity · Relationships · Verification · Evidence · Consent · Monitoring

identical for every industry

+

VERIFICATION POLICY

What “verified” means for this relationship

configuration, not code

=

INDUSTRY WORKFLOW

Zero new services. Zero forks.

SIXTEEN INDUSTRIES, ONE CODEBASE

Manufacturing · Healthcare · IT · BPO/KPO · Construction · Logistics · Education · Retail · Hospitality · Pharma · Jewellery · Real Estate · Professional Services · Facility Management · Recruitment · Staffing

Manufacturing	Critical Supplier Policy
Healthcare	Healthcare Vendor Policy
IT	Employee BGV Policy
Construction	Critical Contractor Policy
Recruitment	Candidate BGV Policy

POLICY: CRITICAL SUPPLIER

SECTION	CHECKS
Identity	GST · PAN · MCA
Financial	Bank ownership · Turnover
Compliance	Certifications · Licences
Risk	AML · Sanctions · Litigation
Monitoring	Quarterly re-verification

Customers author this themselves. Versioned and immutable once active — an auditor asking “what was your standard in March 2026?” gets an unaltered object.

THE CORE BUSINESS STORY

How an invited company becomes a paying customer.

Act I · The invitation

ABC Technologies wants to onboard **XYZ HR Consultants**. ABC creates a verification request under its Critical Supplier policy.

XYZ receives an invitation, claims `BID-BUS-00231` and completes exactly what ABC's policy requires.

BID returns status, level, evidence-backed results, assessment, date, freshness and audit trail. ABC approves.

XYZ becomes a FREE BID MEMBER.
Not a customer. Pays ₹0. Owns its own record.

Act II · The realisation

XYZ notices it has **200 suppliers of its own** it needs to verify — and it has just experienced how the process should work, from the other side.

XYZ clicks “Verify My Own Network”.

XYZ selects a policy, starts verification, and purchases a subscription plus verification credits.

XYZ becomes a PAYING BID CUSTOMER.
Simultaneously a verified subject for ABC and a requester for its own network.

Act III · The compounding

XYZ invites **LMN Components**. LMN becomes a BID member — free, permanent, its own record.

Some of LMN's checks are **reused** from its existing verified attributes under consent and freshness rules.

Later, LMN may become a requester itself. Then OPQ. Then RST.

ABC → XYZ → LMN → OPQ → RST

The critical distinction: the first invitee is not automatically a customer. They become a member for free — and a customer only when they want to verify someone themselves.

NETWORK EFFECT

Customers fund the acquisition of the next generation of members.

Enterprise customer
↓
Invites its network
↓
BID members (free)
↓
Verified organizations
↓
Some become requesters
↓
They invite their network
↓
More members
↓
More customers
↓
Stronger network ↻

The economics of density

The second time an entity is verified, most attributes are already current and disclosable under consent. Marginal provider cost falls sharply. **Price does not fall proportionally.** That gap is the business.

The honest constraint

A network is worth nothing until it is dense. We assume **no network value for the first 12–18 months** and the product must win standalone on workflow, evidence, audit trail and monitoring. Density beats breadth: 500 verified suppliers in one region and a few adjacent categories is worth more than 5,000 scattered nationally, because reuse only fires when two buyers want the same entity.

Where reuse actually applies

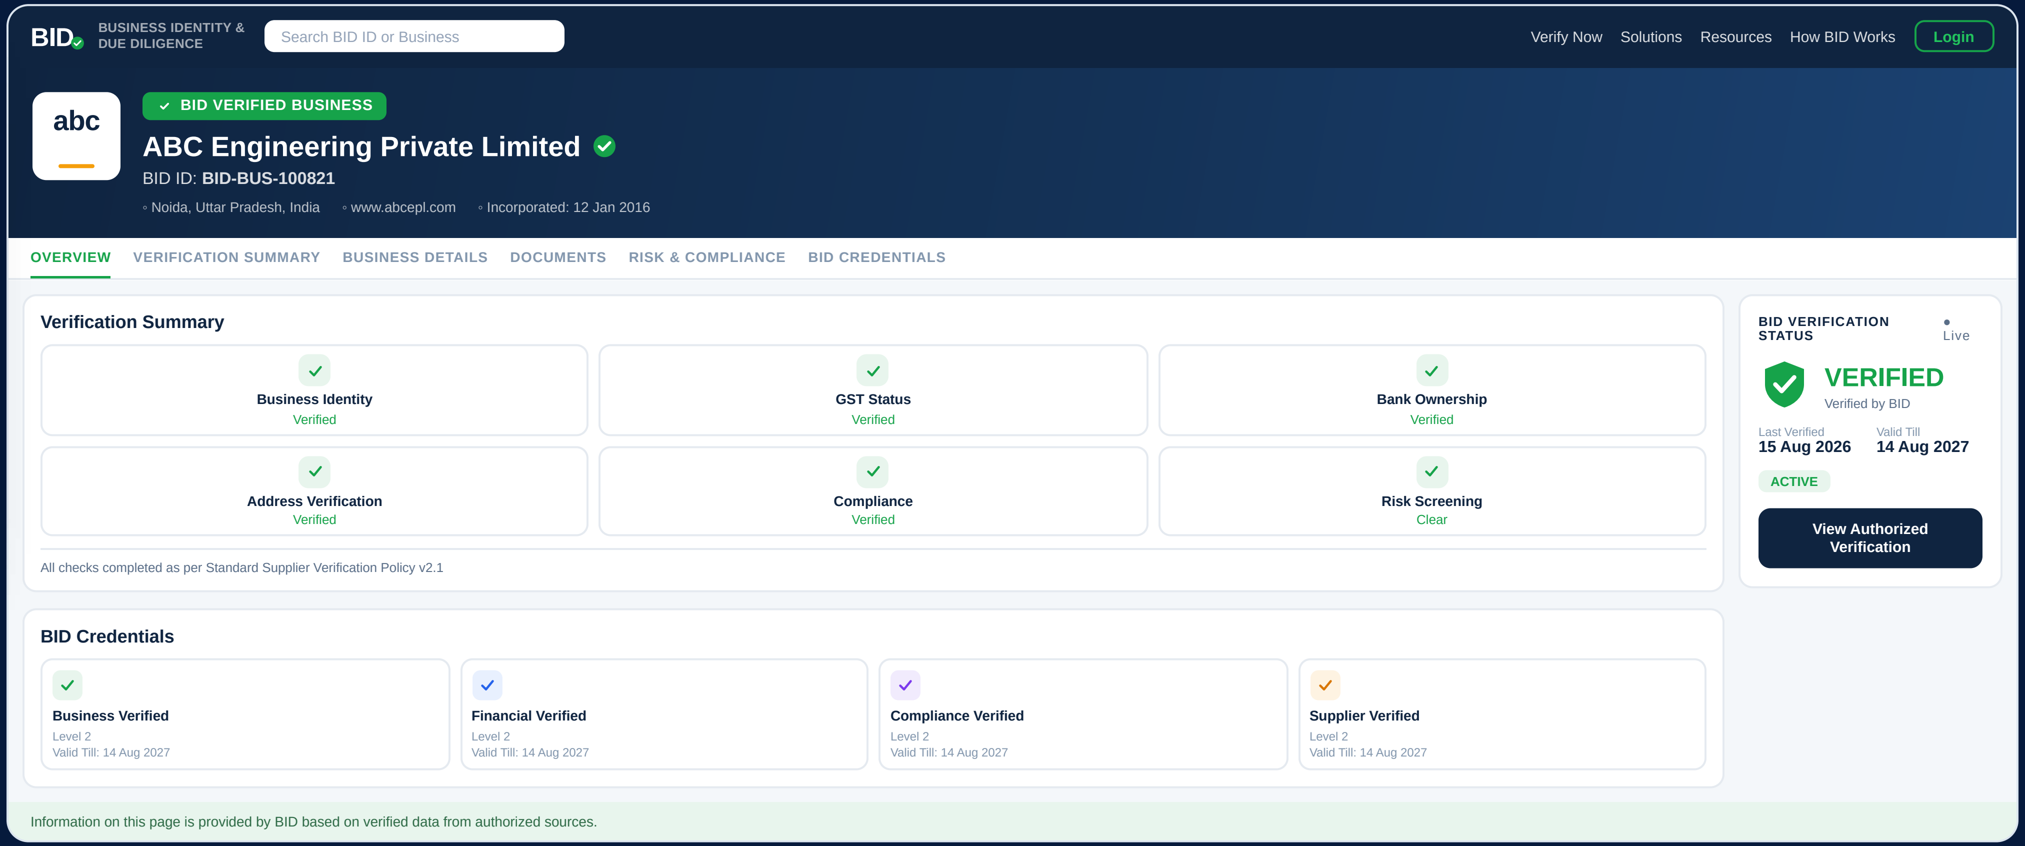
Business-registry checks reuse well across buyers. Manual person-side checks largely do not — for consent, validity and ethical reasons. **The network effect is mostly a business-verification phenomenon**, and we plan on that basis.

THE VISIBLE LAYER

BID ID, Digital Card and public profile.

The card is not the product — it is the visible identity layer.

Tap or Scan to Verify



The rule that protects the whole proposition: BID-verified and company-provided information are separated structurally, always, and no adverse risk finding ever appears on a public page.

THE CREDIBILITY QUESTION

Who gives BID the authority to verify?

Nobody. BID is not a government authority — and never claims to be.

What BID actually is

An independent private verification and trust platform that verifies information against sources it is lawfully permitted to use, and records exactly how.

SOURCES BID USES

- Official and authorized data sources where available
- Authorized verification providers and regulated intermediaries
- Licensed commercial verification providers
- Direct issuer and employer confirmations
- Entity-provided evidence, with consent

For every single verification, BID records:

WHAT was checked | SOURCE | METHOD | WHEN | RESULT | SCOPE | FRESHNESS

**“Don't trust the badge.
Verify the verification.”**

BID never says “this company is trustworthy”. It says: verified against source X, by method Y, on date Z, to scope S. The decision stays with the enterprise — and so does the defensible record.

Trust without unnecessary disclosure.

Minimum necessary disclosure is an architectural principle, not a policy document. The buyer gets what they need to make and defend a decision — and nothing beyond it.

INSTEAD OF EXPOSING	BID DISCLOSES
Exact turnover: **₹18.4 crore**	Required turnover threshold: **VERIFIED**
Entire employment record with dates, salaries and reasons for leaving	Required employment history: **VERIFIED**

Regulatory context: India's DPDP Rules were notified on 14 November 2025. Consent-manager provisions take effect 13 November 2026 and the substantive compliance obligations from 13 May 2027, with penalties up to ₹250 crore. **This is a dated, non-speculative tailwind** — but final implementation requires qualified counsel, and we make no legal guarantees.

PRIVACY PRINCIPLES, ENFORCED IN CODE

Consent · Purpose limitation · Access control · Data minimization · Audit · Retention · Deletion · Security

ENTERPRISE-GRADE SECURITY

Encryption · MFA · SSO · RBAC · ABAC · Tenant isolation · Audit logs · Evidence integrity · API security · Incident response

Two things BID will never do: build a public or searchable database of individuals' background information, or sell personal data. The moat must never depend on either — that is both an ethical line and a commercial one.

REVENUE MODEL

Recurring platform, consumption, and services.

STARTER	GROWTH	BUSINESS	ENTERPRISE
₹9,999	₹24,999	₹49,999	₹1,00,000
/month, from	/month, from	/month, from	/month, from

LINE	STARTING PRICE	TYPE
1 · Enterprise SaaS subscription	from ₹9,999/mo	Recurring
2 · Business verification	from ₹499/check	Consumption
3 · Re-verification	from ₹499	Consumption
4 · Continuous monitoring	from ₹49/entity/mo	Recurring
5 · Candidate BGV	from ₹499/package	Consumption
6 · Employee verification	from ₹499/package	Consumption
7 · Contractor verification	from ₹199/worker	Consumption
8 · Enhanced due diligence	from ₹999	Consumption
9 · API usage	from ₹14,999/mo + usage	Recurring
10 · Enterprise integration	from ₹2,00,000	One-time

Illustrative starting prices. Final pricing depends on scope, provider costs, volume, SLA and enterprise requirements. These are not validated final market prices, and we do not publish a price list until provider quotations are in.

Target mix at maturity

~55% recurring · **~35%** consumption · **~10%** services

Services land accounts; they must never become the business. A services-heavy mix destroys the multiple and consumes the engineering team.

Illustrative unit economics

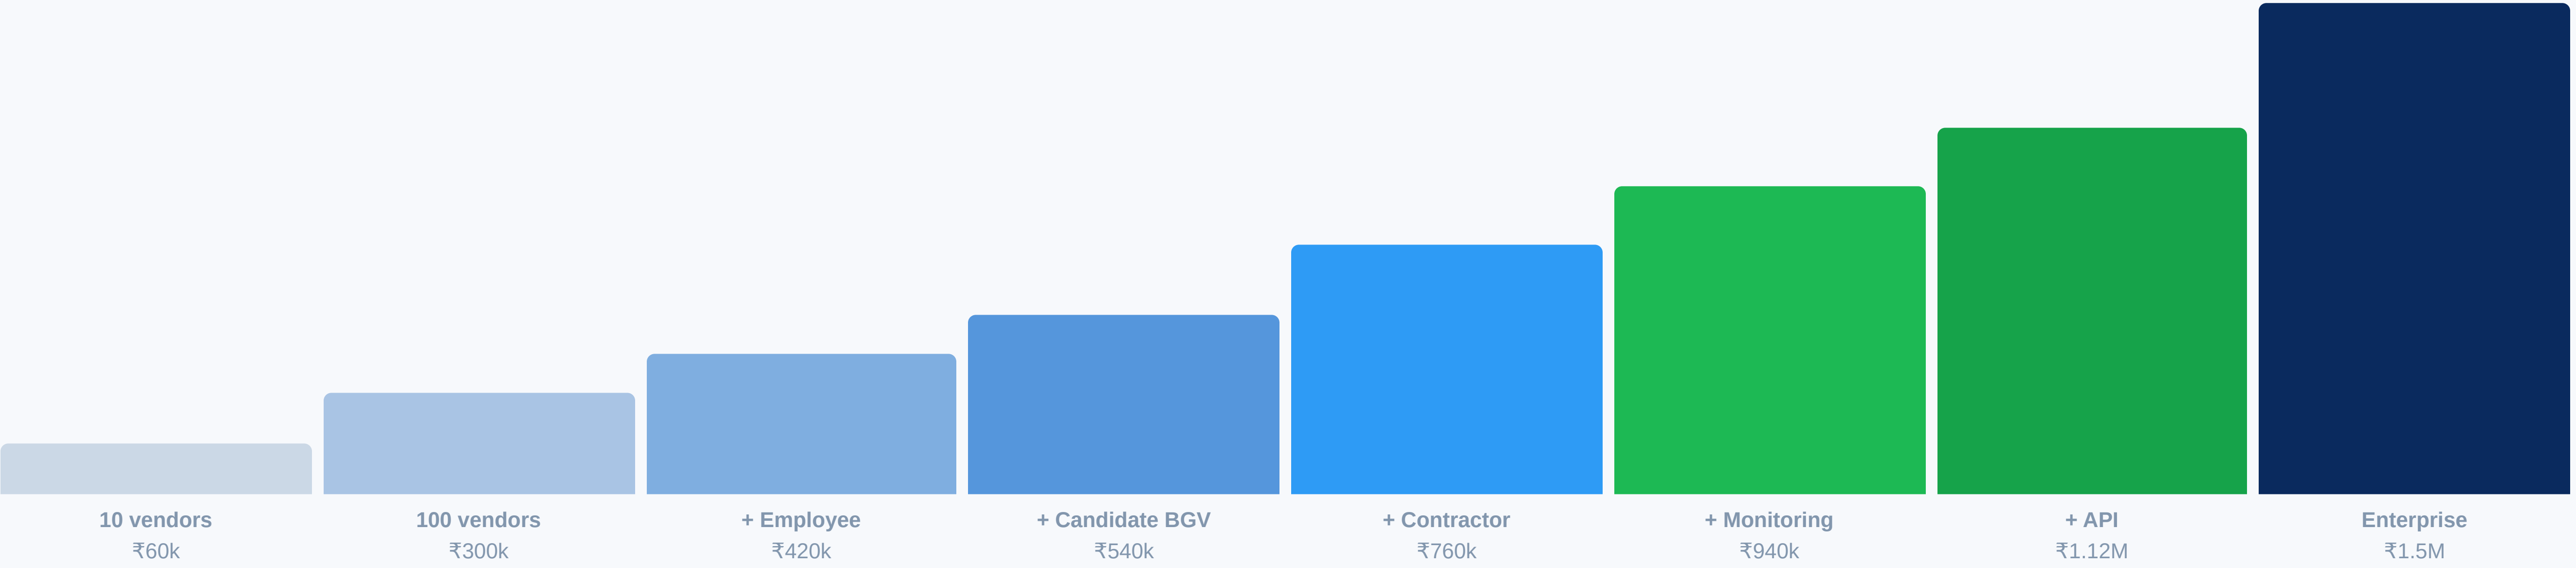
Customer pays	**₹999**
Provider cost (assumed)	₹60
Internal + infra + support	₹58
Payment gateway	₹20
Gross contribution	**₹861**
Gross margin	**~86%**

All figures illustrative and assumption-based. No provider cost here reflects a real quotation.

CUSTOMER EXPANSION

One customer, eight expansion steps.

XYZ starts with a 10-vendor pilot. Expansion comes from more entities, more relationship types and more functions — never from renegotiating the subscription.



Different budgets, not a bigger one

Vendors sit with procurement. Workforce sits with operations and EHS. BGV sits with HR. Each expansion opens a new wallet inside the same account.

Monitoring is the retention line

A customer receiving useful alerts every month does not churn. Monitoring attach rate is our strongest predicted churn signal.

Same engine, new policy

Every one of these steps is configuration, not a new product. That is the commercial payoff of the domain-agnostic architecture.

Illustrative annual contribution for a single mid-market account. Not a forecast.

BID sits at the intersection of categories that are each already funded.

CATEGORY	PUBLISHED MARKET SIGNAL	SOURCE
Third-party risk management	2025 estimates ranged **$6.8B–$9.3B**; CAGRs 14–18.5%	Multiple analyst firms
Background check software (global)	**$4.8B** (2025) → **$10.1B** (2033), ~9.9% CAGR	Grand View Research
Identity verification (India)	**~$451–494M** (2024) → **~$1.72B** (2033), ~15–16% CAGR	UnivDatos
India company base	**>2 million** active registered companies	MCA / Statista

We are deliberately not showing you a single TAM number

Analyst estimates for the third-party risk management market in 2026 alone range from roughly **$6.5B to $16.8B** depending on scope and methodology — a 2.5× spread. Quoting one of them as if it were fact would tell you more about our slide-making than our market. These figures are directional evidence that the categories are real and growing, nothing more.

Where BID sits

Not inside any one of these categories — across the workflow that currently spans all of them.

KYB · business identity checks

TPRM · vendor and third-party risk

BGV · people verification

Identity verification · individual identity

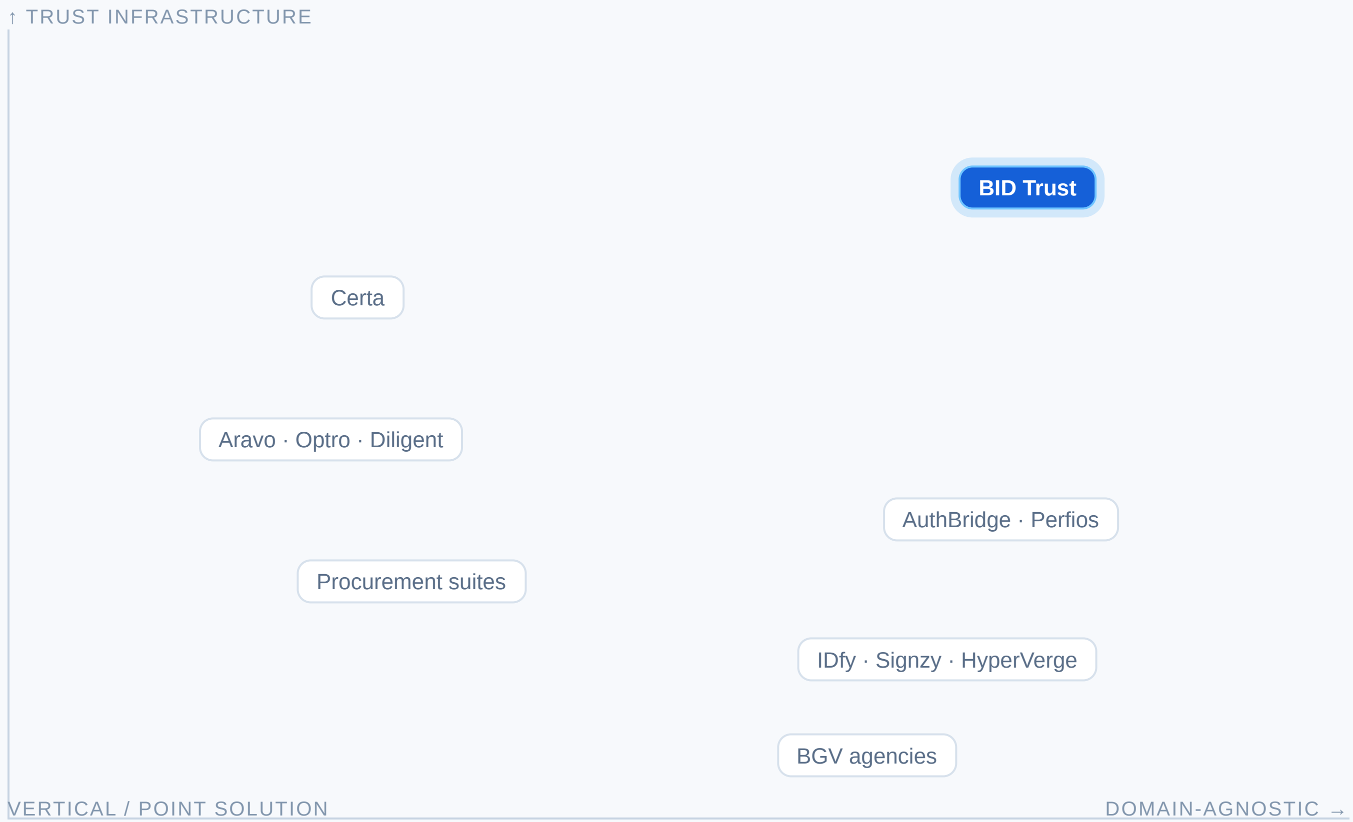
Compliance & monitoring · continuous assurance

The honest framing: BID does not create a new market. It unifies fragmented trust workflows that enterprises already pay for across several existing categories.

Sources: TPRM sizing per multiple analyst firms (Mordor Intelligence, DataM Intelligence, The Business Research Company, Research & Markets — estimates diverge materially); background check software per Grand View Research; India identity verification per UnivDatos; India active company count per MCA data as reported by Statista. Figures accessed August 2026 and not independently audited.

COMPETITIVE LANDSCAPE

Specialists are deep. Nobody owns the layer between them.



Global TPRM platforms

Certa (~$50.6M raised), **Aravo**, **Optro** and **Diligent** — the latter three named Leaders in the 2026 Gartner MQ for TPRM Tools. Deep enterprise workflow, global pricing, limited Indian data depth, and no coverage of people or contract workforce.

Indian KYB / identity specialists

IDfy ($24.3M, Feb 2026), **Signzy** (~$38.7M total), **Perfios** (₹10,000 Cr valuation; acquired Karza for ~$80M), **HyperVerge**. Excellent data coverage. These are suppliers to BID, not rivals.

BGV agencies

AuthBridge, **OnGrid**, **SpringVerify** and others. Operational scale and HR relationships; services economics, little policy configurability, no continuous monitoring.

The real incumbent

Spreadsheets, email and a CA firm. It is free at the point of use, has no procurement cycle, and wins most deals. We displace a manual process far more often than we displace a product.

Positioning is our assessment based on publicly available information as of August 2026; funding figures per Tracxn and press reports; Gartner MQ for Third-Party Risk Management Tools for Assurance Leaders published 6 April 2026. Not an endorsement by, or a partnership with, any company named. Independent validation recommended before external use.

DIFFERENTIATION & MOAT

What is an advantage today, and what compounds later.

Initial advantages — copyable

Real, useful, and not moats. We do not call these defensible.

Domain agnostic · Organization-centric · Relationship-centric · Configurable policies · Provider neutral · Evidence-backed · Consent-driven · Explainable assessment · API-first · Business + people

Compounding assets — the actual moat

- **Evidence history** — years of timestamped, sourced verification records a competitor cannot backfill
- **Reusable credentials** — entities that are already verified, under consent, with live validity
- **Enterprise integrations** — embedded in ERP, HRMS and procurement workflows
- **The verification graph** — entities, relationships, policies and credentials at density

HOW THE MOAT IS BUILT, IN ORDER

Stage 1 · Workflow + provider orchestration

↓

Stage 2 · Policy engine + evidence history

↓

Stage 3 · Reusable credentials

↓

Stage 4 · Enterprise integrations

↓

Stage 5 · Network effects

↓

Stage 6 · Verification graph / trust infrastructure

Hard constraint: the moat must never depend on selling personal data or on a searchable database of people. Both are ruled out permanently — which removes an obvious monetisation path and is the correct trade.

One wedge, built properly, before anything else.

Phase 1 · MVP
- Organization identity + BID ID
- Invitations
- Business verification
- Policy engine
- Verification workflow
- BID profile + digital card
- Reports, basic billing

Phase 2
- BGV + employee verification
- Contractor verification
- Continuous monitoring
- Provider orchestration
- Consent + advanced audit

Phase 3
- Public API
- Enterprise integrations
- Credentials + wallet
- Advanced risk

Phase 4
- BID Network
- Credential portability
- Network analytics
- Geographic expansion

THE MVP STORY WE VALIDATE FIRST

ABC creates policy → **Invites XYZ** → **XYZ joins BID** → **Business verification** → **Result + profile + card** → **ABC approves** → **XYZ verifies its own vendor** → **XYZ pays**

Everything in Phase 1 exists to make the last two boxes happen. If an invited member does not convert to a requester, the business is an enterprise SaaS tool with hard unit economics — not a network. That conversion is the first thing we prove, not the last.

Go-to-market wedge
Vendor and supplier verification, Indian mid-market and enterprise. IT, manufacturing, healthcare, construction, logistics, BPO, professional services.

Pilot ladder
10 vendors → 50 → 100 → enterprise rollout. Paid pilots only — a free pilot has no internal owner and no urgency.

Partner strategy
BGV, KYB, identity, financial-data and document providers as ecosystem partners; HRMS, ERP, procurement, RPO and staffing firms as channels.

RISKS

What could break this — and what we are doing about it.

RISK	WHY IT IS REAL	MITIGATION
Provider dependency	Our suppliers are also our most natural competitors, and pricing is outside our control.	Two qualified routes for every required check; automatic failover; per-call cost ledger; reuse rights negotiated in every contract from the first one.
Cold start	The network is worth nothing until dense; reuse only fires when two buyers want the same entity.	Product must win standalone for 12–18 months; regional and category density before breadth; anchor customers whose vendor base seeds the graph.
Vendor completion rate	If invited vendors do not finish, campaigns stall and the flywheel never starts.	Disproportionate investment in the vendor-side flow; assisted onboarding; regional languages; measured from campaign one against an >80%/7-day target.
Verification costs	Every margin number rests on unvalidated provider pricing.	Quotations before any public price list; pass-through clauses; no multi-year fixed consumption pricing.
Regulatory complexity	Credit information, financial data and identity channels are each restricted differently.	Counsel engaged pre-launch; product designed to degrade gracefully if any single source is unavailable; never assume access.
Enterprise sales cycles	Long cycles can outrun runway.	Mid-market first; paid pilots; land-small motion; annual prepay.
False positives	Name-matching on court and sanctions data is unreliable; a wrong finding harms a real business or person.	Potential-match framing only; mandatory human disposition; dispute workflow; dismissed matches remembered so the same false positive is not re-raised.
Data privacy & trust	A breach of background or relationship data would end the company.	Sensitive data segregated with independent keys; tenant isolation as the primary pen-test target; minimal retention; ISO 27001 and SOC 2 on the roadmap.

INVESTMENT THESIS

Why now.

01

Third-party dependence is rising

Enterprises run on suppliers, contractors and outsourced workforces. Exposure grows with every tier.

02

Verification is still fragmented

Multiple agencies, APIs, spreadsheets and no system of record. The workflow layer is genuinely unowned.

03

API ecosystems have matured

Verification is now programmatic for entities authorized to use each channel — orchestration became possible.

04

AI improves the workflow

Document anomaly detection, extraction and analyst triage — used to flag and route, never to conclude.

05

Privacy regulation has a date on it

India's DPDP Rules were notified 14 Nov 2025. Consent-manager provisions commence 13 Nov 2026; substantive obligations 13 May 2027; penalties up to ₹250 crore. Ad hoc verification over email and spreadsheets becomes an untenable practice — **a dated forcing function, not a hope.**

06

Continuous risk is the new standard

Point-in-time verification is increasingly seen as insufficient by auditors and large customers.

07

Specialists stay specialised

The strongest players are deep in one check type. The layer between them is still open.

The window: the orchestration position is available for a few years, not many. It closes when a well-capitalised specialist moves up-stack or a global TPRM platform localises. Speed on the wedge and density in one region are the whole strategy.

DPDP Rules dates per PIB and legal commentary, accessed August 2026. Regulatory interpretation requires qualified counsel; no legal guarantees are made.

WHY BID CAN WIN

Become the easiest way for an organization to do seven things.

01	02	03	04	05	06	07
Identify who it is dealing with	**Define** what must be verified	**Execute** through trusted providers	**Understand** the evidence	**Decide** and record why	**Maintain** trust over time	**Reuse** credentials where appropriate

Every business relationship begins with one question:

Can I trust who I'm dealing with?

BID is building the infrastructure to answer it.

bidtrust.in

Trust, backed by verification.

APPENDIX

Hard questions.

The fifteen questions most likely to decide this investment — with the answers we actually believe, including where we are uncertain.

1 · Isn't this market crowded?
Crowded with specialists, empty at the orchestration layer. The specialists are our suppliers. Our real incumbent is a spreadsheet, and it wins most deals today.

2 · Why won't IDfy, Signzy or AuthBridge build this?
Some will try. Moving up-stack requires enterprise workflow depth and a different sales motion; and a provider-owned orchestration layer is worth less to buyers because it will always route to itself. It is a head start, not a permanent barrier.

3 · What authority do you have to verify?
None, and we never claim any. We are a private platform. Authority comes from transparency — what was checked, from which source, by what method, when, to what scope, and how fresh.

4 · Why would an invited company join?
Their customer asked, and the alternative is a document pack over email. Reuse is the durable pull. Completion rate is the metric that proves it, and we have no data yet.

5 · Why would they ever pay?
They never pay to be verified. They pay when they switch sides and want to verify their own counterparties — a different budget, and a product they have already personally used.

6 · How do you avoid becoming a BGV company?
By never leading with BGV. It is price-driven, thin-margin and does not seed the network. We enter it from inside an existing vendor-verification account, on workflow and transparency rather than price.

7 · What is the moat, honestly?
Today, none — we have a head start. Over time: evidence history, reusable credentials, embedded integrations and the verification graph. We separate advantages from moats deliberately.

8 · What if reuse is contractually forbidden?
Then margin expansion disappears and we become a pass-through reseller. It is our single most important supplier term and we negotiate it from the first contract, not the tenth.

9 · Enterprise sales cycles will kill you.
Which is why we sell mid-market first, charge for pilots so they have an internal owner, land in one function, and expand into adjacent budgets rather than renegotiating.

10 · Are your margins real?
Modelled, not measured. Every provider cost is a placeholder. Two lines already fall below our 70% target under current assumptions and we can tell you exactly which and why.

11 · How do you handle false positives?
Screening produces potential matches, never conclusions. Human disposition is mandatory with a recorded reason, dismissed matches are remembered, and any entity can dispute a finding about itself.

12 · What is your liability if you get it wrong?
We report evidence with source, method, timestamp and scope — not conclusions — so the decision and the record stay with the customer. Plus bounded contractual liability and indemnity cover. Final terms need counsel.

13 · Doesn't the network need personal data to work?
No. Business data reuses under consent; a person's background result does not, ever. That genuinely limits network effects on the people side and we plan accordingly.

14 · How does this scale technically?
Event-driven and async by default, because issuer and human checks take days. Tenant isolation enforced in the data layer. The hard scaling problem is operations — exception handling and assisted onboarding — not compute.

15 · What kills this company?
A breach of background or relationship data, or a well-capitalised specialist moving up-stack before we reach density. The first is an engineering and governance problem; the second is a speed problem. Both are why this round exists.

16 · What would make you shut it down?
If pilots show vendor completion below roughly 50% and it cannot be moved, or if provider economics make ₹499-class pricing structurally loss-making at volume. Both are testable within two quarters.
