One Link. Infinite Possibilities.

Enterprise Digital Identity & Verification Platform

Business and technical proposal for a centralised digital identity, verification and workforce information platform — for universities, healthcare, corporates, financial services and field workforces.

One link. Infinite possibilities.

INFINITIA HUB

An enterprise digital identity solution by **Infinitia Hub**

How to read this proposal

CORE PLATFORM

Capabilities proposed as part of the standard Infinitia Links deployment scope. Exact availability is confirmed during discovery.

OPTIONAL

Integrations or modules scoped and quoted separately. They may require third-party hardware, software or subscriptions.

FUTURE ROADMAP

Capabilities under consideration, subject to feasibility and customer demand. Not committed in this proposal.

Demonstration content. All people, organisations, employee IDs, QR codes, screenshots and figures shown in this document are fictional and labelled DEMO. They do not represent any real institution, employee or customer. Demonstration QR codes do not open live verification links.

01 · EXECUTIVE SUMMARY

A single, verifiable identity for every member of your workforce

Infinitia Links is a centralised digital identity, verification and workforce information platform. Every employee receives a secure, mobile-accessible digital identity card with a unique QR code. The organisation issues, manages, verifies, updates, suspends and deactivates those identities from one administrative dashboard.

Physical ID cards remain useful, but they are slow to issue, costly to replace and impossible to check for current validity. A printed card cannot tell a visitor, patient, customer or security officer whether its holder is still employed, suspended, or authorised for a particular role. Infinitia Links closes that gap: the QR code on each identity opens a secure verification page that checks the credential's **live status** with the issuing organisation.

Issue
Individually or by Excel/CSV, on your own branded templates

Carry
On any smartphone via a secure link — no app required

Verify
Anyone scans the QR to see current, server-side status

Govern
Renew, suspend or revoke centrally, with a full audit trail

What this proposal covers

- Digital identity cards with six configurable templates
- QR verification with active, suspended, expired and revoked states
- Enterprise admin dashboard and credential lifecycle management
- Bulk onboarding with validation and error reporting
- Optional staff directory and staff service links
- Sector use cases: education, healthcare, corporate, financial services, field workforce
- A dedicated field executive and loan recovery agent module
- Optional integrations: NFC, access control, SSO, HRMS/ERP, GPS
- Security, privacy and governance approach
- Deployment methodology, rollout plans and a commercial framework

Recommendation

We recommend a phased approach: a short discovery, configuration of branding and structure, a pilot in one department or branch, and a full rollout once the pilot is accepted. Pricing is provided as an editable framework and will be quoted after discovery.

Scope note. Infinitia Links manages identity credentials and their verification. It connects to — but does not replace — HRMS, payroll, attendance or ERP systems. QR verification confirms credential status; it does not independently prove the physical identity of the person presenting it.

02 · BUSINESS CHALLENGES

Why physical identity cards are no longer enough

Organisations of every kind face the same set of identity problems — amplified by multiple branches, contract staff, visiting professionals and field teams.

Challenge	Impact on the organisation	How Infinitia Links addresses it
Slow, costly issuance and reissue	Delays for new joiners; budget spent on reprints for lost, damaged or outdated cards	Identities are generated digitally, individually or in bulk, and updated without reprinting
No way to check current validity	A printed card looks valid even after suspension or exit	Every QR opens a server-side check of live credential status
Leavers' cards remain in circulation	Security and reputational risk; misuse of the organisation's name	Revocation takes effect at the next scan; revoked IDs never appear valid
Fragmented records	Identity data scattered across spreadsheets, HR systems and card vendors	One administrative record per credential, with status history
Unverifiable field staff	Customers cannot confirm that a field visitor or agent is genuinely authorised	Agent identities with employer, service area, status and official contact channels
Inconsistent branding	Different campuses and branches issue different-looking cards	Centrally managed templates, logos and colours
Limited administrative visibility	No clear view of who currently holds a valid credential	Dashboard of active, suspended and expired IDs plus verification analytics

Who feels the pain

- **HR & registry** — issuance, renewals, exits
- **Security & facilities** — checking staff at the gate
- **IT** — consistent, secure identity data
- **Leadership** — brand, risk and compliance

Who verifies identity

- Visitors, parents and partners on campus
- Patients and families in hospitals
- Clients visiting corporate offices
- Customers receiving field or collection visits

03 · PRODUCT OVERVIEW & POSITIONING

A centralised digital identity, verification & workforce information platform

Infinitia Links is not simply an online ID card generator. It is the system of record for workforce identity credentials: issuance, presentation, verification, lifecycle management and governance in one configurable platform.

Brand hierarchy

Infinitia Hub
Parent technology company

Infinitia Links
The digital identity platform

"..." Powered by Infinitia Links
Discreet endorsement on identity pages — the client organisation's brand always leads

Core principles

- **Organisation-branded** — each customer has its own logo, colours, templates, fields and roles.
- **Verifiable by design** — every credential has a unique, non-guessable verification link.
- **Privacy-first** — the organisation decides what is visible, to whom.

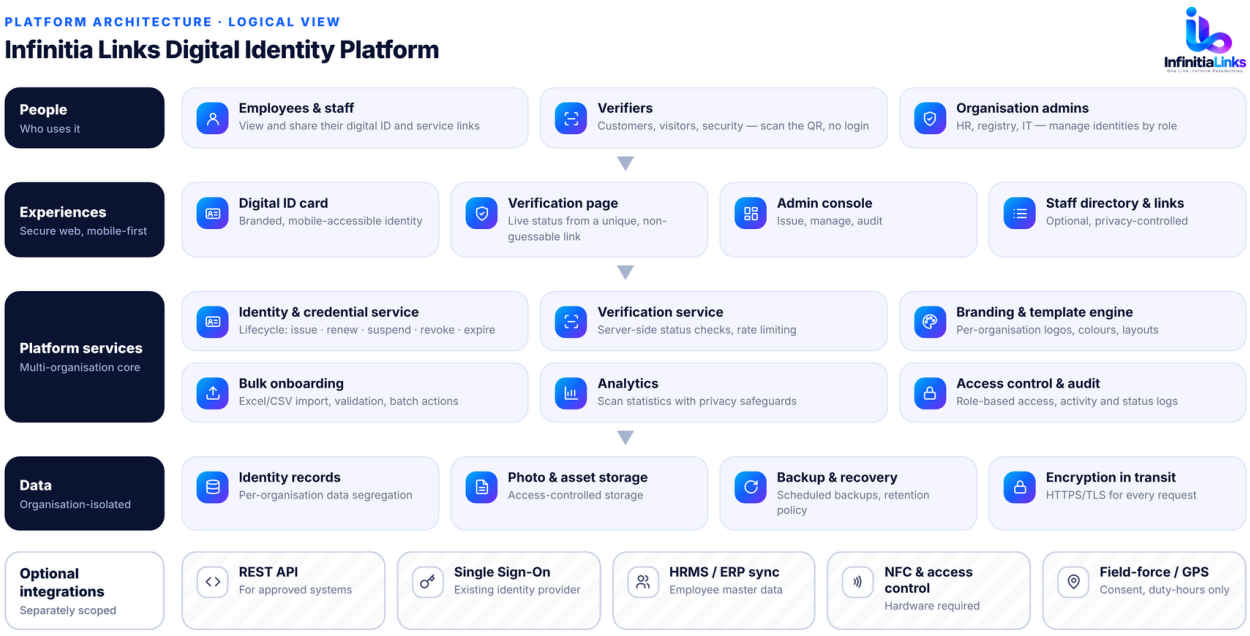

Sample corporate digital ID · fictional employee

Capability overview

Capability area	Summary	Status
Digital identity cards	Branded, mobile-accessible identity with photo, role, validity and QR	CORE
QR verification	Server-side status check; active / suspended / expired / revoked	CORE
Admin dashboard & lifecycle	Issue, edit, renew, suspend, revoke; status history and audit	CORE
Bulk onboarding	Excel/CSV import, validation, batch generation and actions	CORE
Directory, links, integrations	Privacy-controlled directory and service links (configurable); API, SSO, HRMS/ERP, NFC, GPS (optional)	CONFIG OPTIONAL

04 · SOLUTION ARCHITECTURE OVERVIEW

A multi-organisation platform with server-side verification at its core

Logical architecture · dashed components are optional, separately scoped integrations

Experiences

Employees open their identity on a mobile browser through a secure link. Verifiers scan the QR code with any phone camera — no app or login is required. Administrators work in a web console with role-based access.

Platform services

The identity & credential service owns each credential and its lifecycle. The verification service answers every scan from the server, so a changed status is reflected immediately. The branding engine renders each organisation's templates.

Data

Each organisation's records are logically segregated. Photographs and assets are held in access-controlled storage. All traffic is encrypted in transit (HTTPS/TLS). Backup frequency and retention are agreed per deployment.

Why server-side verification matters

The QR code contains only a unique, non-guessable reference — never personal data or a status flag. A screenshot of an old card therefore cannot show a valid status once the credential has been suspended or revoked.

05 · DETAILED FEATURE DESCRIPTIONS

Platform modules at a glance

Module	Key capabilities	Status
Digital identity card	Organisation logo and branding; photograph; full name; unique employee ID; designation; department; branch or location; employment category; joining date (where appropriate); validity / expiry; unique QR; credential status; official contact; emergency contact (where authorised)	CORE
QR verification	Unique verification URL per credential; server-side status; verified / not-active result; photograph and approved fields; issuing organisation; validity; timestamp; withheld details for non-active credentials	CORE
Overview dashboard	Total employees; active, suspended and expired IDs; recently issued IDs; verification statistics; lifecycle tasks needing attention	CORE
Employee management	Add, edit and view employees; upload photograph; assign department and branch; update designation; change credential status; renew ID	CORE
Bulk management	Excel/CSV import; column mapping; validation with error reports; bulk ID generation; bulk activation, renewal and suspension	CORE
Verification analytics	Total and daily scans; verification history; date and time; privacy-safe source (device type, approximate city where enabled)	CORE
Organisation management	Organisation profile; logo; brand colours; ID templates; branches; departments; administrative roles	CORE
Security & audit	Role-based access; admin activity history; credential status history; access logs; secure authentication; data-export permissions	CORE
Staff directory	Search by name or ID; filter by department, designation, branch; approved fields only; visibility settings per field	CONFIGURABLE
Service links	HR portal, leave portal, helpdesk, handbook, circulars, training, events, department sites, emergency information, feedback & grievance	CONFIGURABLE
Field agent module	Employer and agency details; authorised service area; status; complaint and callback links; official contact; verification history	CONFIGURABLE
Integrations	REST API; SSO; HRMS / ERP synchronisation; NFC cards; access control; visitor management; attendance; GPS / geofencing; SOS; mobile wallet	OPTIONAL

Status labels describe the proposed scope. Final availability, configuration and any custom work are confirmed in the discovery phase and documented in the statement of work.

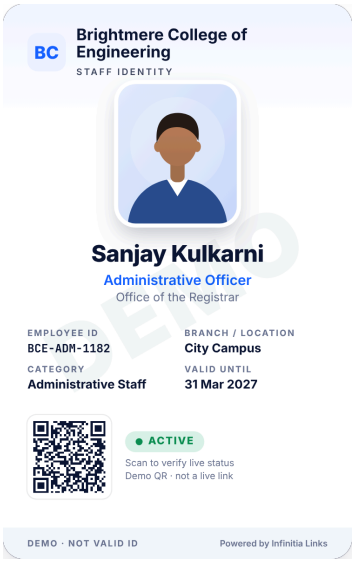

06 · DIGITAL ID SAMPLES & TEMPLATES

Six templates, configurable to each organisation

Templates are starting points. Each organisation sets its own logo, colours, field selection and layout. The samples below show fictional identities for six roles.

University Institutional
University professor

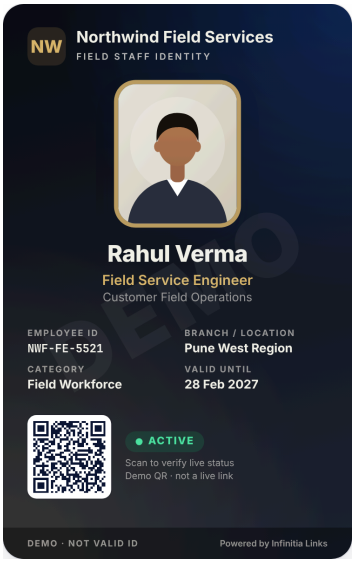

Modern Minimal White
College administrative staff

Premium Corporate Blue
Corporate employee

Healthcare Professional
Hospital employee

Premium Dark
Field executive

Financial Services
Loan recovery agent

All six identities are fictional and marked DEMO · NOT VALID ID. Demonstration QR codes encode a placeholder reference, not a live verification link. No real institution's official card has been imitated.

06 · DIGITAL ID SAMPLES & TEMPLATES

The identity experience on a phone

University staff | Corporate employee | Hospital employee | Field executive

Identity fields and how they are controlled

Field	Shown on card	Shown on verification page	Control
Logo, name, photograph	Yes	Yes (active credentials)	Required
Employee ID, designation, department	Yes	Yes	Required
Branch / location, category	Yes	Configurable	Organisation setting
Joining date	Optional	Usually hidden	Organisation setting
Validity / expiry, status	Yes	Yes	Required
Official contact	Optional	Configurable	Organisation setting
Emergency contact	Only where authorised	Never public	Explicit authorisation

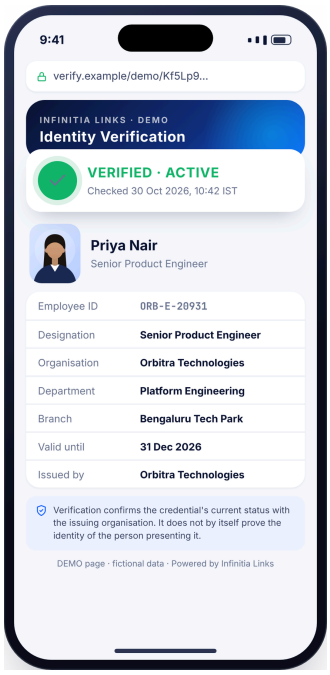

Employees can show their identity from a link or home-screen shortcut, share their profile link, open service links and save a copy of their card. Wallet-pass and NFC variants are optional integrations.

07 · QR VERIFICATION EXPERIENCE

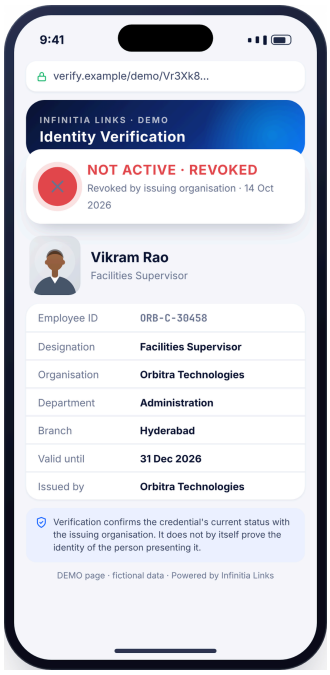

Live status, in seconds, without an app

Verification workflow

1. **ID presented**
   The employee shows their digital (or printed) identity.
2. **QR scanned**
   The verifier scans with any phone camera.
3. **Secure URL opens**
   A unique, non-guessable link for that credential only.
4. **Status checked server-side**
   The platform looks up the credential's current status.
5. **Approved details shown**
   Only fields the organisation has approved.
6. **Verdict**
   Active, suspended, expired or revoked — with a timestamp.

Verified · active

Not active · revoked

Verification page content

Verified / Not Active status · employee photograph · name · employee ID · designation · organisation · department · branch · validity · issuing organisation · verification timestamp. For non-active credentials, personal details beyond the minimum are withheld.

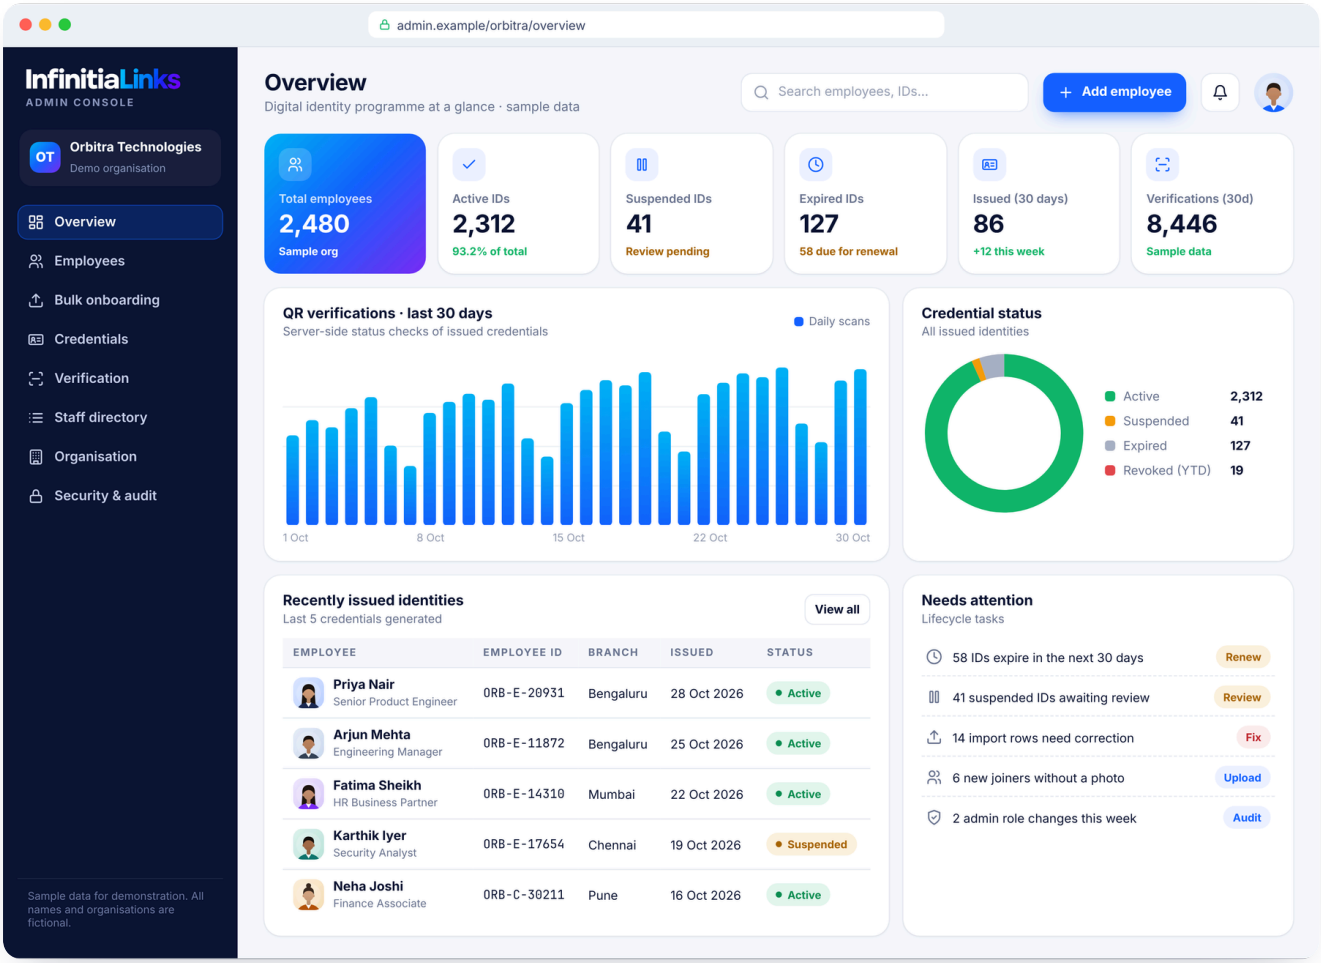

Safeguards

Safeguard	Description
Non-guessable identifiers	Each credential link uses a long random reference, not a sequential employee number.
Server-side verification	No status or personal data is stored in the QR; every scan is answered by the platform.
Revocation	Revoked, suspended and expired credentials never display as valid.
Data minimisation	Confidential employee data is never exposed; only approved fields are shown.
Anti-tampering	HTTPS only; rate limiting; tamper-evident page design; timestamped results.

Important: QR verification confirms the credential's status with the issuing organisation. It does not independently prove the physical identity of the person presenting it — verifiers should compare the photograph.

08 · ADMIN DASHBOARD

One console for the entire identity lifecycle

Overview dashboard · sample data for a fictional organisation

Overview

Total employees, active, suspended and expired IDs, recently issued identities and verification statistics, with lifecycle tasks that need attention.

Employee management

Add, edit and view employees; upload photographs; assign department and branch; update designation; change status; renew IDs.

Organisation management

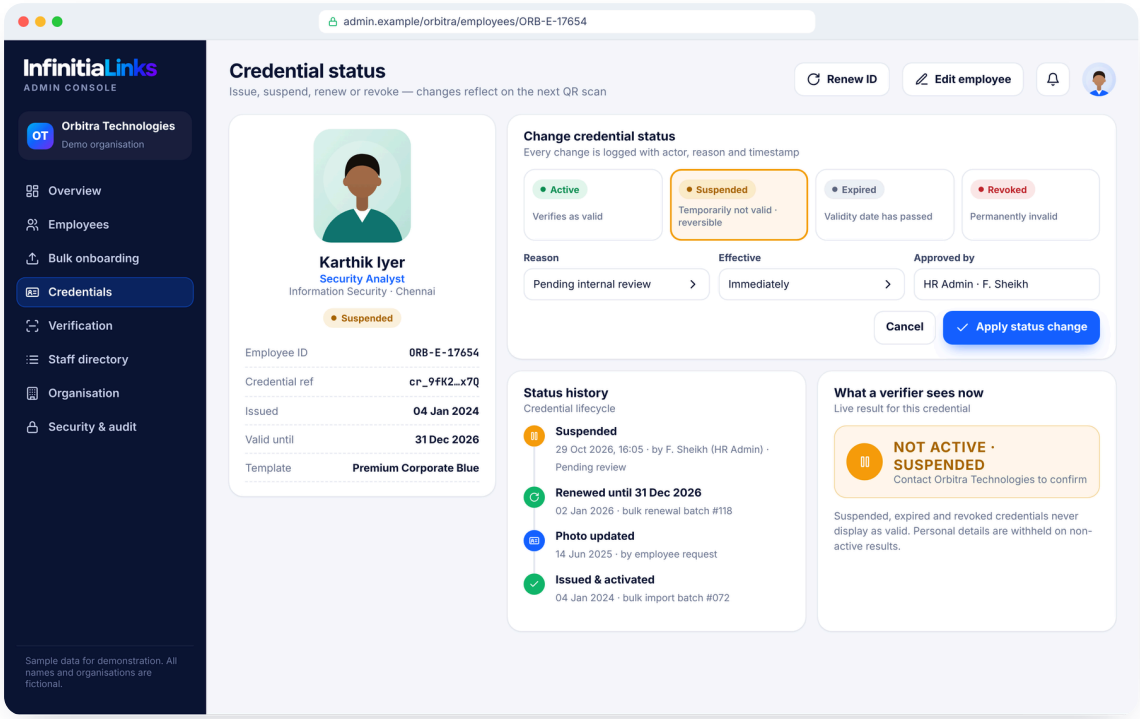

Organisation profile, logo, brand colours, ID templates, branches, departments and administrative roles.

Security & audit

Role-based access, admin activity history, credential status history, access logs, secure authentication and data-export permissions.

08 · CREDENTIAL STATUS & VERIFICATION ANALYTICS

Control every credential — and see how it is used

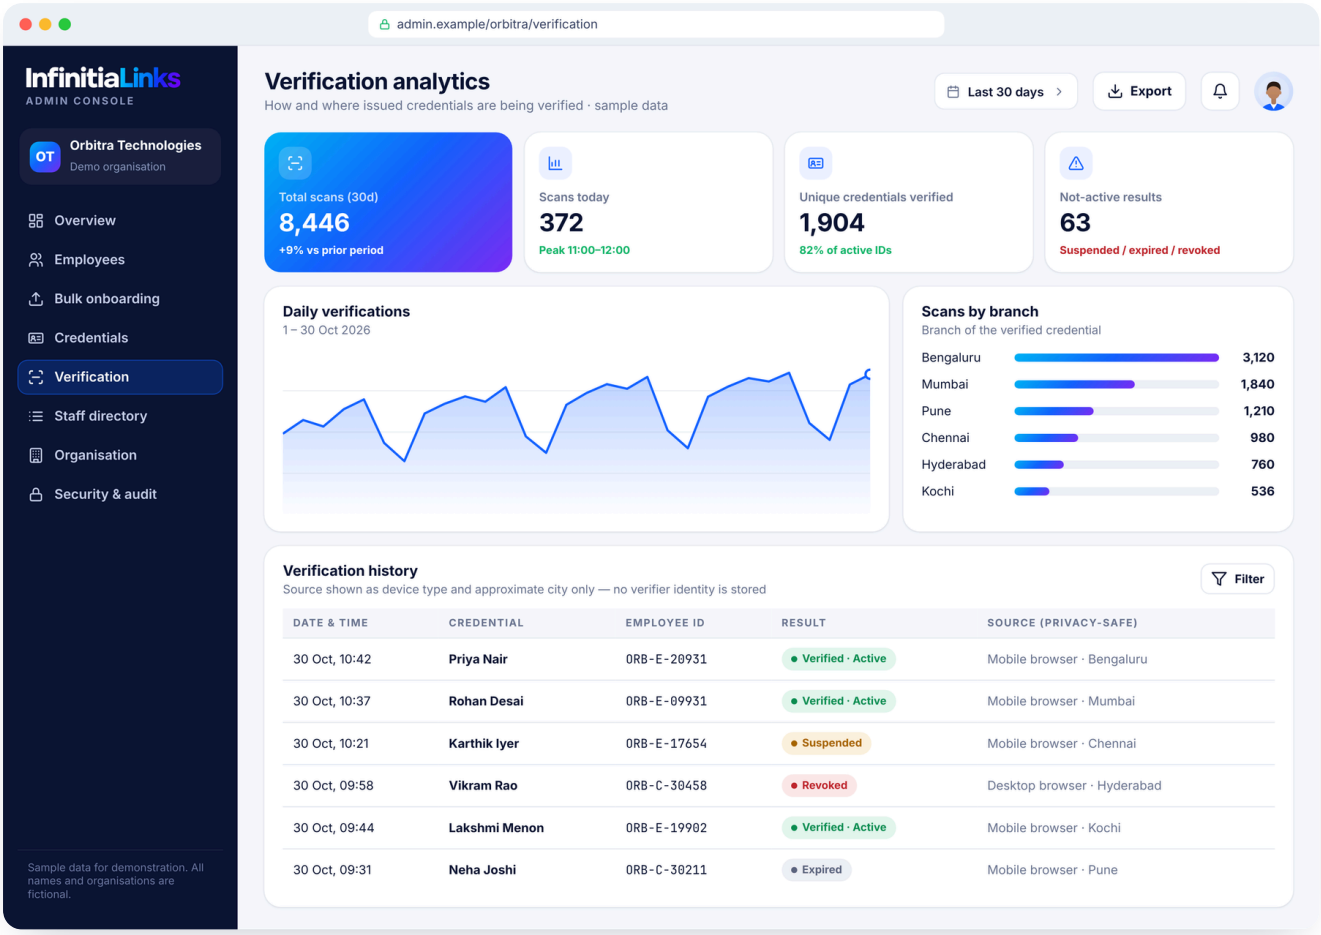

Credential status management with full status history

Status	Meaning	Verification result	Reversible
Active	Credential is valid and within its validity period	Verified · Active	—
Suspended	Temporarily not valid (e.g. under review)	Not active · Suspended	Yes
Expired	Validity date has passed; renewal required	Not active · Expired	Yes, by renewal
Revoked	Permanently invalid (e.g. exit, loss, misuse)	Not active · Revoked	No — reissue instead

Status changes are made by authorised administrators, require a reason and are recorded with the actor and timestamp. Suspended, expired and revoked credentials never display as valid, and personal details are withheld on non-active results.

08 · VERIFICATION ANALYTICS

See how and where credentials are being verified

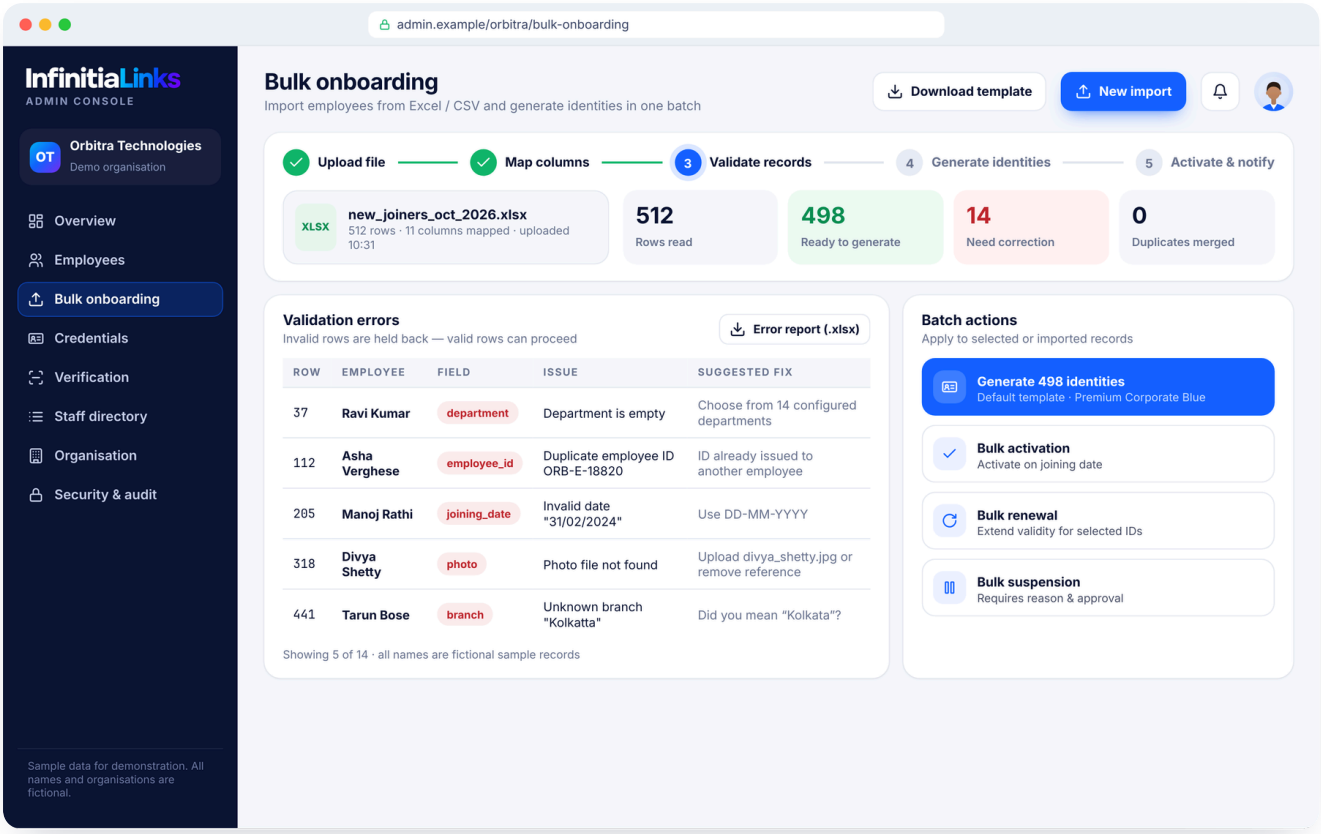

Verification analytics · sample data for a fictional organisation

Metric	Purpose
Total and daily scans	Understand verification volume and peaks across the organisation
Unique credentials verified	See how widely digital identities are being used in practice
Not-active results	Spot attempts to use suspended, expired or revoked credentials
Verification history	Date, time, credential and result for each verification
Verification source	Device type and approximate city only, where enabled — no verifier identity is stored

Privacy safeguard. Verification analytics are designed to support administration and security, not to profile verifiers or employees. Source information is limited, configurable and retained only for the agreed period.

09 · BULK ONBOARDING

Hundreds of identities in a single, validated batch

Bulk onboarding · validation results with downloadable error report

Process

1. **Upload**
   Excel or CSV using the standard template, or map existing columns.
2. **Validate**
   Missing fields, duplicates, invalid dates, unknown branches, missing photos.
3. **Correct**
   Invalid rows are held back with an error report; valid rows proceed.
4. **Generate & activate**
   Identities created on the default template and activated on the chosen date.

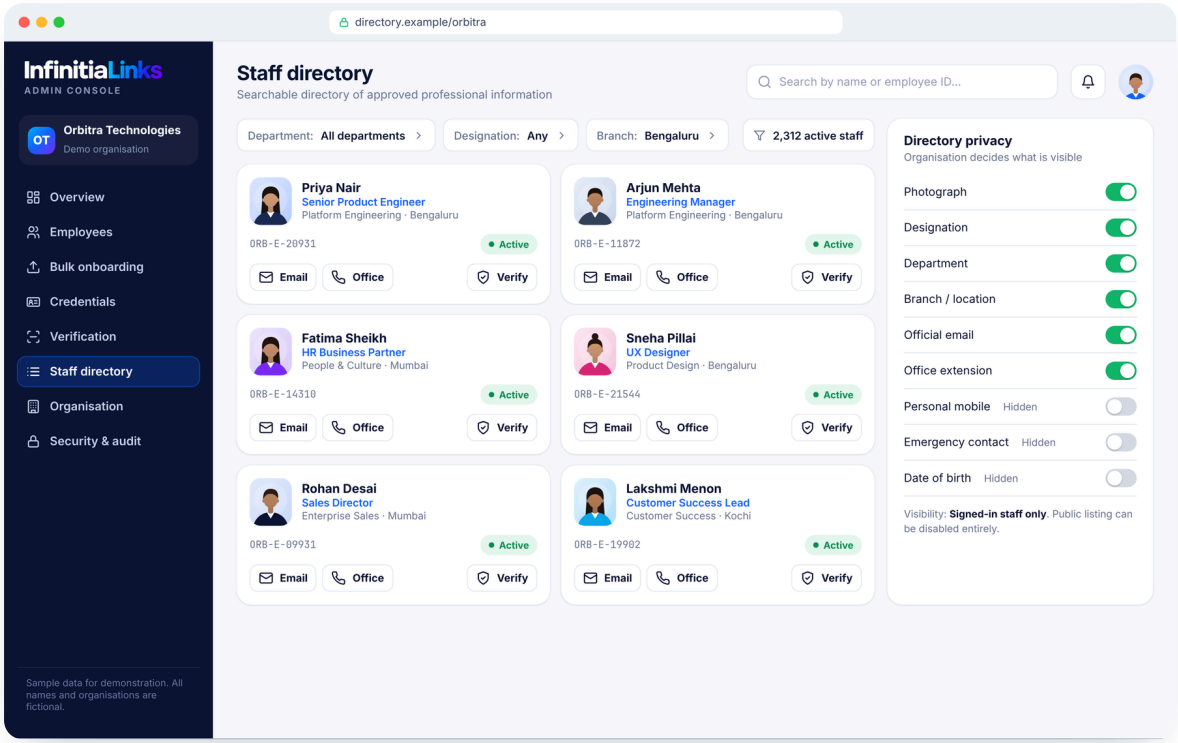

Standard import template

Column	Required
employee_id	Yes · unique
full_name	Yes
designation, department	Yes
branch, category	Yes
joining_date, valid_until	Valid until: yes
official_email, photo_file	Recommended

Bulk activation, renewal and suspension use the same selection and approval flow, with reasons recorded in the audit log.

10 · STAFF DIRECTORY & COMMUNICATION MODULES

Find the right person — reach the right service

Optional staff directory with organisation-controlled visibility

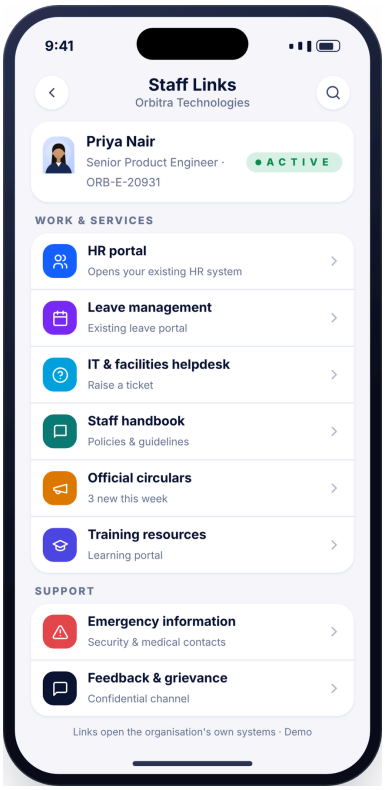

Staff directory CONFIGURABLE

Search by employee name or ID; filter by department, designation or branch; display approved professional information; give direct access to official contact channels where authorised. The organisation decides whether the directory is disabled, visible to signed-in staff only, or public — and which fields appear.

Staff service links CONFIGURABLE

The identity page can link to existing organisational resources: HR portal, leave management, internal helpdesk, staff handbook, official circulars, training resources, event registrations, department websites, emergency information, and feedback & grievance channels.

> These links open the organisation's **existing** systems. Infinitia Links is not a complete HRMS, payroll or attendance management system.

Staff links page

11 · INDUSTRY-SPECIFIC USE CASES

One platform, configured for every sector

Sector	Typical organisations	Representative uses
Education	Universities; engineering, medical, dental, nursing and pharmacy colleges; schools; autonomous and research institutions	Faculty and staff IDs; multi-campus administration; visitor-facing verification for parents, examiners and partners; academic directory; LMS and library links
Healthcare	Hospitals, clinics, diagnostic centres, medical institutions	Clinical, nursing and support staff IDs; time-bound credentials for visiting consultants; patient-facing verification; rapid deactivation
Corporate	IT companies, manufacturing, corporate offices, business groups, multi-branch organisations	Employee and contractor IDs; onboarding and offboarding; branch-level administration; client-facing verification
Financial services	Banks, NBFCs, financial service providers, loan recovery and collection agencies	Branch staff and agent identities; customer verification of field visits; complaint and callback channels
Field workforce	Field executives, sales representatives, service engineers, delivery and inspection personnel, contract staff	Customer-verifiable identity at the doorstep; authorised service area; official contact; verification history

ONE PLATFORM · MANY ORGANISATIONS

Each organisation keeps its own identity

Logo, colours, template, fields and visibility are configured per organisation. Data stays segregated.

Aldervale University
University Institutional template

Orbitra Technologies
Premium Corporate Blue template

Halcyon Care Hospital
Healthcare Professional template

Kestrel Finserv
Financial Services template

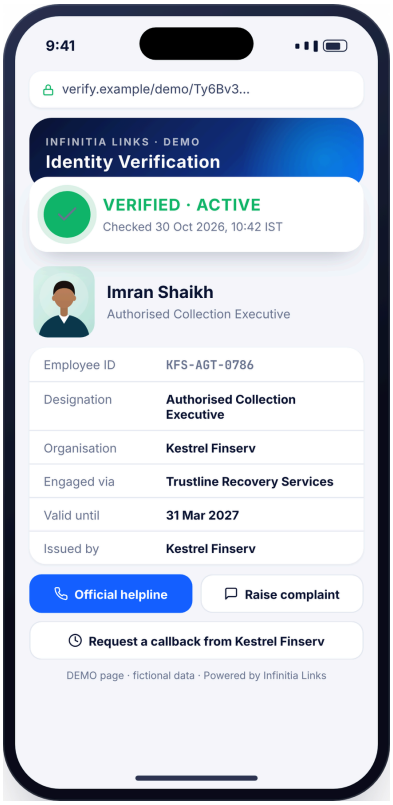

Each organisation keeps its own branding, templates, structure, permissions and administrative controls

12 · FIELD EXECUTIVE & LOAN RECOVERY AGENT MODULE

Customers can confirm a field visitor is genuinely authorised

Agent digital ID

Customer verification view

Module features

- Agent digital identity
- QR-based customer verification
- Employer and agency information
- Designation and authorised service area
- Active / suspended / expired status
- Customer complaint link
- Callback request link
- Official company contact
- Verification history for the organisation
- Duty-based location features **OPTIONAL**

Privacy and compliance safeguards

Principle	How it is applied
No borrower data on public pages	Borrower account numbers, loan amounts, personal financial information and confidential customer details are never shown on identity or verification pages.
Organisation-approved authorisation	Agent authorisation, lender assignments and service areas are provided and approved by the relevant organisation. Infinitia Links displays them; it does not authorise agents or validate lender assignments.
Immediate deactivation	When an engagement ends or is suspended, the next scan shows the agent as not active.
Customer recourse	Complaint and callback links route to the organisation's official channels.
Location (optional)	Only with explicit permission, during duty hours, with limited retention and a visible indicator.

Organisations remain responsible for complying with the regulatory requirements and codes of conduct that apply to their collection and field activities.

13 · OPTIONAL ADVANCED INTEGRATIONS

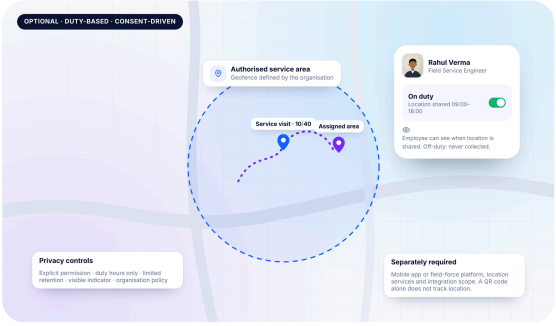

Extend the platform when you need to

The capabilities below are **optional** or **future** integrations. They are not automatically available and are scoped, quoted and scheduled separately.

Integration	What it enables	Separately required	Status
NFC-enabled ID cards	Tap-based identification at readers	NFC cards, encoding, readers	OPTIONAL
Physical access control	Door and turnstile decisions using credential status	Controllers, readers, vendor API	OPTIONAL
Attendance integration	Pass identity to an existing attendance system	Attendance platform, devices	OPTIONAL
Visitor management	Host verification for visitor workflows	Visitor-management platform	OPTIONAL
GPS, field-force & geofencing	Duty-based location and service-area checks	Mobile app / field-force platform	OPTIONAL
Emergency SOS	Alert routing for field staff	Mobile app, response process	ROADMAP
REST API	Status lookups and data exchange with approved systems	Integration scope, API agreement	OPTIONAL
Single Sign-On	Admin and employee sign-in via existing identity provider	Customer identity provider	OPTIONAL
HRMS / University ERP	Synchronise employee master data	System access, mapping, approvals	OPTIONAL
Mobile wallet credentials	Wallet passes, if supported through a future integration	Wallet provider programme	ROADMAP

NFC & access control — hardware required

Duty-based GPS — consent-driven

A standard QR code does not provide NFC, biometric attendance, physical access or continuous GPS tracking. NFC readers, access-control hardware, GPS services, mobile applications, third-party APIs and associated subscriptions may be separately required.

14 · SECURITY, PRIVACY & GOVERNANCE

Identity data is sensitive — governance is designed in

Employee identity information is sensitive organisational data. Each deployment is configured according to applicable data-protection laws and the customer's own policies.

Control area	Approach
Employee data management	Per-organisation data segregation; access-controlled photo storage; defined data owners
Role-based administrative access	Roles for HQ, branch and department administrators; least-privilege permissions; export permissions
Unique credential identifiers	Long, random, non-guessable references for every credential link
QR verification controls	Server-side checks, rate limiting, approved-field display, timestamps
Revocation & expiry	Immediate effect at next scan; renewal reminders; expiry automation
Audit trails	Admin activity, credential status history and access logs with actor, reason and time
Data minimisation & visibility	Only necessary fields collected; organisation controls every visible field
Consent & transparency	Employees informed what is displayed and where; consent captured where applicable
Retention & deletion	Retention periods agreed per deployment; deletion on exit or contract end per policy
Secure transmission	HTTPS/TLS for all traffic
Backup & recovery	Scheduled backups and a documented recovery process; targets agreed per deployment

Location features (optional)

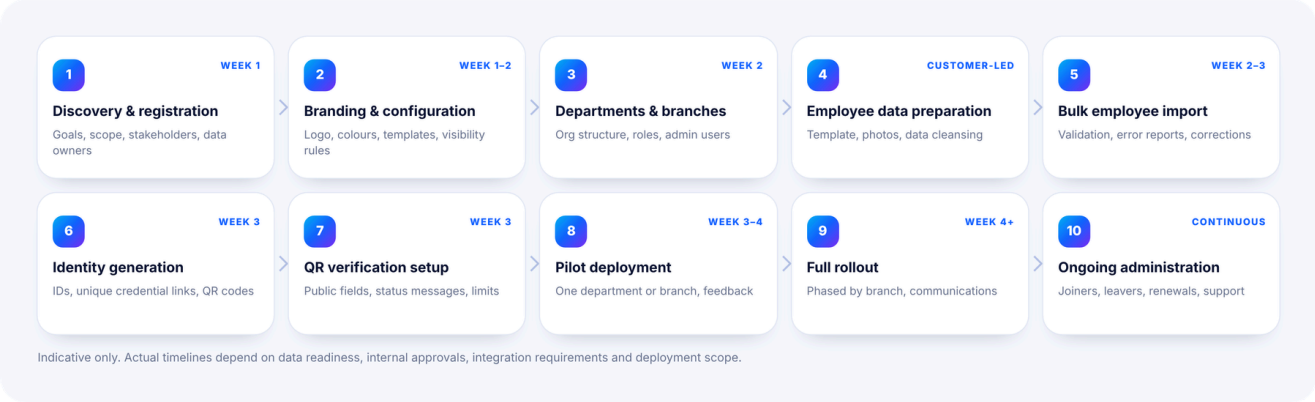

- Explicit permission from the employee
- Clear duty-based controls — no off-duty collection
- Limited, defined retention
- Transparent, visible location-sharing indicator

Certifications

This proposal makes no claim of ISO, SOC, GDPR or other certification. Security documentation and any customer-required assessments are addressed during discovery.

15 · DEPLOYMENT METHODOLOGY

A structured ten-stage onboarding

#	Stage	Key activities & deliverables	Led by
1	Registration & discovery	Objectives, scope, stakeholders, data owners, policies; discovery summary	Joint
2	Branding & configuration	Logo, colours, template selection, field visibility; approved card design	Infinitia Links
3	Departments & branches	Organisation structure, admin roles and users	Joint
4	Employee data preparation	Template completion, photographs, data cleansing	Customer
5	Bulk employee import	Validation, error reports, corrections	Joint
6	Identity generation	Credentials, unique links and QR codes	Infinitia Links
7	QR verification configuration	Public fields, status messages, contact channels	Joint
8	Pilot deployment	One department or branch; feedback and sign-off	Joint
9	Full rollout	Phased activation; employee communications	Joint
10	Ongoing administration & support	Joiners, leavers, renewals, support requests	Customer, supported

Actual timelines depend on data readiness, approvals, integration requirements and deployment scope.

16 · SCALABILITY & ROLLOUT PLANNING

From a single department to thousands of employees

The platform is designed for multiple organisations, branches and administrators. Rollout is phased so that each wave is validated before the next.

Deployment size	Pilot	Rollout approach	Admin model	Indicative timeline*
100 employees	Full group	Single-phase launch	1–2 central admins	2 – 3 weeks
500 employees	One department	Two phases	Central + department admins	3 – 5 weeks
2,000 employees	One branch or faculty	Phased by branch	Central + branch admins	5 – 8 weeks
5,000 employees	One or two branches	Phased by region / unit	Delegated multi-level admins	8 – 12 weeks

*Indicative only, assuming clean data and timely approvals, and excluding optional integrations. Actual timelines depend on data readiness, approvals, integration requirements and deployment scope.

Sample rollout plan — 2,000 employees

Week	Activities
1	Discovery; branding and template approval; structure and admin roles
2 – 3	Data template issued; customer prepares data and photographs; first import and validation
4	Pilot branch identities generated and activated; verification configured; staff briefing
5	Pilot feedback, adjustments and sign-off
6 – 8	Remaining branches activated in waves; communications; handover to administrators

Multi-organisation

Separate branding, data and admins for each organisation or group company.

Multi-branch

Branch-level administrators and reporting under a central view.

Batch operations

Import, renew and suspend at scale with validation and audit.

17 · COMMERCIAL MODEL

A transparent, modular pricing framework

The framework below is editable. All prices are placeholders and will be quoted after discovery. **No figure in this document is an approved quotation.**

Component	Basis	Price
Initial setup & onboarding	One-time	**₹[To be quoted]**
Branding & configuration	One-time	**₹[To be quoted]**
Per-employee annual subscription	Per active employee, per year	**₹[To be quoted]**
Enterprise annual subscription	Per organisation, per year	**₹[To be quoted]**
API & integration	Per integration	**Separately quoted**
NFC / GPS hardware	Per card / device	**Separately quoted**
Custom development	Per agreed scope	**Based on scope**

Illustrative comparison by deployment size

Shows which components typically apply — not prices.

Component	100	500	2,000	5,000
Setup & onboarding	Standard	Standard	Extended	Extended
Subscription model	Per-employee	Per-employee	Per-employee or enterprise	Enterprise
Admin roles	Central	Central + dept.	Multi-branch	Multi-level
Integrations	Usually none	Optional	Often SSO / HRMS	Typically scoped
Price	₹[To be quoted]	₹[To be quoted]	₹[To be quoted]	₹[To be quoted]

Revenue models available

Annual subscription
Platform access billed yearly.

Per-employee licensing
Scales with active identities.

Enterprise licensing
Organisation-wide licence.

Initial onboarding
One-time setup and configuration.

Integration services
API, SSO, HRMS / ERP work.

Premium modules
Optional add-ons as scoped.

18 · BUSINESS BENEFITS & ROI FRAMEWORK

What organisations gain

Benefit	How it is achieved
Reduced dependency on physical ID replacement	Digital identities are updated without reprinting; physical cards become optional
Faster issuance of employee credentials	Individual or bulk generation on approved templates
Centralised identity management	One record and status per credential, across branches
Faster identity verification	Any phone camera; no app or login for verifiers
Better credential lifecycle management	Renewals, suspensions and revocations with history
Easier onboarding and offboarding	Issue on day one; revoke on exit with immediate effect
Improved administrative visibility	Dashboard of active, suspended and expired credentials
Consistent organisation branding	Centrally managed templates across all locations
Convenient mobile access	Identity available on the employee's phone
Better verification auditability	Timestamped, privacy-safe verification history

ROI framework — transparent assumptions

We do not quote savings in advance. Instead, ROI is estimated with the customer using their own figures:

Annual card cost avoided = (employees × reissues per employee per year × cost per physical card) + (new joiners × cost per card)

Administrative time saved = (cards issued or updated per year × minutes saved per card ÷ 60) × loaded hourly cost

Net annual value = card cost avoided + time saved − annual subscription [To be quoted]

Qualitative value — reduced impersonation risk, faster verification and better auditability — is assessed alongside, not converted into invented monetary figures.

19 · RESPONSIBILITIES & ASSUMPTIONS

A clear division of responsibilities

Infinitia Links will

- Provide and operate the platform for the agreed scope
- Configure branding, templates, structure and roles
- Support data import, validation and identity generation
- Configure QR verification and approved fields
- Support the pilot and phased rollout
- Provide administrator onboarding and support as agreed

The organisation will

- Nominate a project owner and administrators
- Provide accurate employee data and photographs
- Approve card designs, visible fields and policies
- Inform employees and obtain consent where applicable
- Provide and approve any agent authorisations and service areas
- Maintain employee status (joiners, leavers, changes)

Assumptions

- Employee data is supplied in the agreed template, with photographs meeting basic quality guidelines.
- Approvals for designs, fields and policies are provided within the agreed timeline.
- Optional integrations, hardware and custom development are outside the base scope unless specified in the statement of work.
- Timelines in this document are indicative and are finalised after discovery.
- Configuration complies with applicable data-protection laws and the organisation's policies, as agreed with the organisation.

Out of scope (unless separately agreed)

- HRMS, payroll, attendance or examination management functionality
- Physical card printing, NFC hardware, readers and access-control devices
- Authorisation of field or recovery agents, or validation of lender assignments

Terminology. "Credential" refers to a digital identity issued to one employee; "verification" refers to checking a credential's status via its QR link; "organisation" refers to the customer issuing the credentials.

20 · CONCLUSION & NEXT STEPS

Every employee, verifiably identified. Every identity, centrally governed.

Infinitia Links gives your organisation a branded, mobile-accessible digital identity for every employee, live QR verification for everyone who needs to check it, and one console to manage the full credential lifecycle — configured to your structure, your policies and your brand.

Proposed next steps

1 · Discovery call

Objectives, scope, data readiness and policies.

2 · Pilot scope

One department or branch, success criteria and timeline.

3 · Tailored proposal

Configuration, statement of work and quotation.
