

BID Trust

BUSINESS IDENTITY & DUE DILIGENCE

Trust, backed by verification.

An industry-agnostic trust, verification and due-diligence infrastructure for modern business relationships.

bidtrust.in

Seed round

India-first, category-neutral

WHAT TO SAY

Open with the sentence, not the company: “Every business relationship starts with one question — can I trust who I'm dealing with?” Then: we are building the infrastructure that answers it. Do not open with features. Do not say “KYC”, “KYB” or “BGV” in the first two minutes — those words will anchor the investor into a commoditised category and you will spend the rest of the meeting climbing out.

WHY IT MATTERS

The single biggest risk in this pitch is being mentally filed as “another verification vendor”. Category framing is decided in the first 60 seconds. The words that must land early are **infrastructure**, **orchestration** and **network**.

“So you're a KYC company?”

No — and the distinction is the whole business. KYC and KYB companies sell checks. We sell the layer above them: the policy that decides what needs checking, the orchestration that routes it, the evidence record that survives an audit, and the monitoring that keeps it true. We buy from those companies; we don't compete with them. Slide 5 shows exactly where we sit.

Every company answers the same question, over and over, about a different counterparty.

“Can I trust this business or person enough to work with them?”

The counterparty changes

Supplier, contractor, candidate, distributor, consultant, partner, service provider.

The work does not

Collect documents, chase the counterparty, verify, judge, file the evidence, repeat in twelve months.

Nobody owns the record

Verification produces a decision, not a defensible, sourced, timestamped record.

It goes stale immediately

A vendor verified in January can be struck off by March. Almost nobody re-checks.

BID connects **identity + relationships + verification + evidence + assessment + credentials + monitoring** into one trust layer — so that question gets answered once, properly, and stays answered.

WHAT TO SAY

Land the universality first. This is not a procurement problem or an HR problem — it is the same problem wearing different clothes in every function of every company. Then land the four failures: repeated work, no durable record, no owner, immediate decay. The fourth is the one that becomes recurring revenue.

WHY IT MATTERS

If the investor accepts that this is one problem rather than several, the horizontal platform thesis follows naturally. If they see it as several problems, they will ask why you aren't picking one vertical — and the domain-agnostic story starts to sound like a lack of focus rather than an architectural choice.

“Isn't this just procurement software?”

Procurement software manages the commercial relationship — POs, catalogues, invoices, performance. It answers what you buy and for how much. It does not answer whether the counterparty is who they claim to be, and it does not keep that answer current. We integrate with those suites rather than replacing them; that is a deliberate strategic choice, covered on slide 17.

Trusting a third party is still a fragmented process.

WHAT COMPANIES DO TODAY

Supplier documents

Email threads

Excel trackers

Manual review

Agency A

Agency B

KYB API

BGV vendor

HRMS

Procurement suite

Shared drive

Periodic checks

Audit scramble

Thirteen tools and no system of record. When an auditor asks how a supplier was verified in 2024, somebody searches an inbox.

Consequences

Slow onboarding

Weeks per counterparty

Duplicate verification

Same supplier, twenty buyers

Inconsistent standards

Depth varies by who did it

No visibility

Which vendors are still valid?

Stale verification

Point-in-time, never refreshed

Compliance exposure

Decisions you cannot evidence

The most telling question to ask a prospect: "What percentage of your vendor base has been re-verified in the last twelve months?" Most organisations genuinely do not know. That moment is where the deal starts.

WHAT TO SAY

Walk the pill cloud left to right and let the visual do the work — the point is the sprawl, not any individual item. Then hit the consequences. Close on the re-verification question; it is the single best discovery question in the sales motion and it demonstrates you know how these buyers actually think.

WHY IT MATTERS

This slide has to establish that the incumbent is not a competitor product — it is a manual process with no owner. That reframes the competitive question later: we mostly displace spreadsheets and agencies, not Certa or Aravo.

“Why can’t companies just do this themselves?”

They already are — that is the thirteen-tool picture. What they cannot build internally is the provider relationships, the normalisation layer across incompatible provider responses, the tamper-evident evidence architecture, and the network of already-verified entities. Teams that try end up with a document-collection portal and still call the same agencies. They also inherit the data-protection obligations of handling this data themselves, which under the DPDP rules is now a board-level concern.

One trust layer for every business relationship.

Eight primitives, one platform. Every business relationship in any industry is expressible as a combination of these.

Organization

The primary entity. Not a “vendor”, not a “customer” — an organization.

Person

Employee, candidate, contractor worker, director — consent-gated throughout.

Relationship

Carries the purpose. Purpose is what makes data collection lawful and proportionate.

Policy

What “verified” means for [this](#) relationship. Configurable, versioned, immutable.

Verification

Executed through authorized providers. Orchestrated, not owned.

Evidence

Immutable, hashed, classified at capture. What survives an audit.

Assessment

Deterministic and explainable. Never an opaque score.

Credential + Monitoring

Reusable, expiring, continuously watched. Trust that stays true.

The same eight primitives serve a pharma supplier, a site contractor and a candidate. **Only the policy changes.**

WHAT TO SAY

Do not read the eight boxes. Say: “These eight primitives compose into every third-party relationship there is.” Then give one concrete recomposition — a pharma supplier and a candidate BGV use identical machinery with different policy. That single sentence is the domain-agnostic proof in miniature.

WHY IT MATTERS

This is the architectural claim underneath the whole business. If the primitives are right, one codebase serves sixteen industries and every new sector is configuration. If they are wrong, you are building sixteen products.

“Isn’t ‘horizontal’ just a way of avoiding focus?”

Horizontal in architecture, focused in go-to-market. We sell one wedge — vendor and supplier onboarding, to Indian mid-market — and we do not chase the other fifteen. But we refuse to bake that wedge into the data model, because the second workflow inside an existing customer is the cheapest revenue in the business, and a vertical schema would make it a rewrite.

BID does not replace verification providers. BID is the layer above them.

Provider-neutral trust orchestration

Specialist providers keep doing what they are good at. BID routes to them, normalizes what comes back, stores the evidence and keeps the record alive.

CATEGORIES BID CAN ORCHESTRATE

- KYB
- BGV
- Identity
- GST data
- MCA-derived data
- Bank verification
- Education
- Employment
- Address
- Risk / AML
- Document verification

Why this matters commercially: it converts the largest incumbents from competitors into suppliers — and, plausibly, into channel partners.

No company is claimed as a BID partner. Categories shown are illustrative of what the orchestration layer is designed to route to.

WHAT TO SAY

Slow down here. This is the slide that decides whether you are a vendor or infrastructure. Say it plainly: “We are not trying to out-verify AuthBridge or IDfy. We buy from companies like them.” Then trace the stack top to bottom with a finger. The investor should leave with one sentence: BID sits above the providers.

WHY IT MATTERS

It defuses the two hardest objections at once — “this is crowded” and “the incumbents will crush you”. If BID is a customer of the incumbents rather than a rival, incumbency stops being a threat and starts being supply.

“Why won't the existing BGV/KYB providers just build this themselves?”

Some will try. Three things make it hard. First, culture: API and services businesses are optimised for volume and price per call, not for enterprise workflow depth — moving up-stack means a different product organisation and a different sales motion. Second, neutrality: a provider that builds an orchestration layer will always route to itself, and buyers know it, so the layer is worth less in their hands than in ours. Third, the network: our reuse advantage comes from entities verified across many buyers, which no single provider can assemble without the buyer-side relationships. That said — I would not claim this is a durable technical moat. It is a head start, and slide 18 is honest about which parts compound and which do not.

“What happens if a provider cuts you off or raises prices?”

It is a real dependency and we treat it as a first-order risk. Mitigation is structural: at least two qualified routes for every check that a signed customer policy marks as required, a router that fails over automatically, and a cost ledger per call so we see margin erosion the week it starts rather than at quarter end. The deeper commercial point is that we must secure caching and reuse rights in every provider contract — if reuse is contractually forbidden, our margin-expansion path disappears. That is the single most important term in our supplier agreements, and we negotiate it from the first contract, not the tenth.

Twelve steps, one platform.

Written for a non-technical reader. Everything from “who is this?” to “is it still true?”.

WHAT TO SAY

Do not narrate all twelve. Point at the three summary cards instead — they carry the argument. The line to deliver: “Most of this market starts at step six. The value is in steps one to three and eleven to twelve.”

WHY IT MATTERS

It shows the investor exactly which parts of the value chain are commoditised (the middle) and which are not (the ends). That framing also explains the gross-margin story later.

“How much of this is built?”

Be exact and do not inflate. Give the real state of the MVP (slide 19), what is designed and specified versus what is running, and what the first paying pilot needs. Investors forgive an early product; they do not forgive discovering later that “built” meant “designed”.

Organizations are not permanently vendors, customers or suppliers.

Roles are relationships, not entity types. This one decision is what makes BID domain-agnostic — and what makes verification reusable.

The mistake most platforms make

Modelling “vendor” and “customer” as entity types. The same company then exists as three records, reuse becomes impossible, and the network effect can never be built.

- What this unlocks**
- One company, one record, regardless of how many parties transact with it
 - The same vendor can be “Standard” for one buyer and “Critical” for another, with no conflict
 - A verified subject today can be a paying requester tomorrow — with no migration
 - Purpose limitation becomes technically enforceable, because purpose lives on the relationship

WHAT TO SAY

This is the slide for the technical investor or the operator on the panel. Frame it as a decision with consequences, not a schema: “We refuse to store a company as a vendor, because within eighteen months it will also be a customer, and we would have two records and no reuse.” Then connect it forward — this is precisely why XYZ can flip from verified subject to paying customer on slide 9 without any migration.

WHY IT MATTERS

It is the load-bearing decision under both the domain-agnostic claim and the flywheel. Without it, neither works.

“Is that not just a database design detail?”

It is a database design detail that determines whether the business model is possible. If a company exists as three records, one buyer's verification cannot be reused by the next — and reuse is where the margin expansion and the network effect both come from. It is also the difference between adding a second workflow inside a customer as configuration versus as a rewrite.

Core engine + configurable policy = industry workflow.

SIXTEEN INDUSTRIES, ONE CODEBASE

- ManufacturingHealthcareITBPO/KPOConstructionLogisticsEducation
- RetailHospitalityPharmaJewelleryReal EstateProfessional Services
- Facility ManagementRecruitmentStaffing

Manufacturing	Critical Supplier Policy
Healthcare	Healthcare Vendor Policy
IT	Employee BGV Policy
Construction	Critical Contractor Policy
Recruitment	Candidate BGV Policy

POLICY: CRITICAL SUPPLIER

SECTION	CHECKS
Identity	GST · PAN · MCA
Financial	Bank ownership · Turnover
Compliance	Certifications · Licences
Risk	AML · Sanctions · Litigation
Monitoring	Quarterly re-verification

Customers author this themselves. Versioned and immutable once active — an auditor asking “what was your standard in March 2026?” gets an unaltered object.

WHAT TO SAY

Deliver the equation as a single sentence, then show the policy card as proof it is real and not a slogan. The strongest line: “A new industry is a configuration exercise, not an engineering project.” If you have the live architecture explorer available, this is the moment to show the policy builder — editing a policy in front of an investor is far more convincing than a bullet.

WHY IT MATTERS

Horizontal platforms are usually punished by investors as unfocused. This slide converts horizontal from a market claim into an architectural one, which is defensible.

“Won't every enterprise want customisation you can't support?”

That is what the policy engine exists to absorb. The customisation enterprises actually ask for is which checks, at what depth, with what thresholds, expiry and approval routing — all of which is configuration. We ship a curated template library so nobody starts from a blank page, because a blank policy screen produces either an unusable policy or an abandoned trial. Where a customer genuinely needs something outside the model, we would rather lose that deal early than fork the product.

How an invited company becomes a paying customer.

WHAT TO SAY

Tell this as a story, in three acts, without touching the product. It is the most memorable ninety seconds in the deck — most investors will retell your company using this story, so make it clean. The beat that must land hardest is the end of Act I: **XYZ pays nothing**. Pause there.

WHY IT MATTERS

It answers customer acquisition, network effects and the free-versus-paid boundary in one narrative rather than three slides of assertion. It also shows the acquisition cost of the second generation of members is borne by the first generation of customers, not by us.

“Why would an invited company bother joining?”

Because their customer asked them to, and because the alternative is emailing a document pack. The pull is that the profile is reusable — submit once rather than twenty times, get advance warning of your own expiring licences, and carry a credential into the next tender. But I would not oversell this: vendor completion rate is the metric that decides whether the entire network thesis works, and it is the first number we will prove in pilots. Our design target is above 80% completion within seven days, and if we cannot hit that, the flywheel does not start.

“Why would they ever pay?”

They do not pay to be verified — ever. They pay when they switch sides and want to verify their own counterparties. That is a completely different budget, a different internal owner, and a value proposition they have just personally experienced from the receiving end. It is the warmest possible lead: a company that has already used the product and understood it before any salesperson called.

Customers fund the acquisition of the next generation of members.

The economics of density

The second time an entity is verified, most attributes are already current and disclosable under consent. Marginal provider cost falls sharply. **Price does not fall proportionally.** That gap is the business.

The honest constraint

A network is worth nothing until it is dense. We assume **no network value for the first 12–18 months** and the product must win standalone on workflow, evidence, audit trail and monitoring. Density beats breadth: 500 verified suppliers in one region and a few adjacent categories is worth more than 5,000 scattered nationally, because reuse only fires when two buyers want the [same](#) entity.

Where reuse actually applies

Business-registry checks reuse well across buyers. Manual person-side checks largely do not — for consent, validity and ethical reasons. **The network effect is mostly a business-verification phenomenon**, and we plan on that basis.

WHAT TO SAY

Run the loop once, then immediately volunteer the two constraints. Volunteering the cold-start problem before the investor raises it is worth more than any claim on the slide — it signals you have modelled this rather than drawn it.

WHY IT MATTERS

Every investor has seen a flywheel diagram that was really a wish. The credibility comes from the caveats: no network value for 12–18 months, density over breadth, and reuse being a business-side phenomenon rather than a universal one.

“How do you actually get network effects rather than just drawing them?”

Three preconditions, all measurable. One: vendor completion rate above 80%, or nothing downstream happens. Two: regional and category density, so two buyers genuinely want the same supplier — which is why we saturate Karnataka manufacturing before expanding. Three: buyer willingness to accept network-sourced evidence under their own policy, which we are testing directly in discovery conversations right now. If that third one comes back negative across the board, reuse collapses into an internal cost saving rather than a customer benefit — still valuable, but a materially different business, and we would tell you.

BID ID, Digital Card and public profile.

The card is not the product. It is the visible surface of the trust infrastructure underneath — and every card shared is a distribution event.

COMPANY-PROVIDED INFORMATION
Supplied by the company. Not verified by BID unless individually marked.

Staffing, recruitment and HR advisory for mid-market technology firms. Established 2014.

The rule that protects the whole proposition: company-provided and BID-verified information are separated structurally, always. If that line is ever blurred, the platform's value — the claim that verified means verified — is gone.

WHAT TO SAY

Say “the card is not the product” before anything else, or the investor will file you as a badge company. Then make the point about distribution: every card in a tender, invoice footer or email signature is a warm lead on both sides — the unverified supplier who sees it, and the buyer who receives it.

WHY IT MATTERS

It makes the acquisition loop tangible and shows product discipline: BID controls the authenticity of verification status, while the company controls its own descriptive content, and the two are never mixed.

“Isn't a verified badge easy to fake?”

A screenshot proves nothing, and we say so in the UI. Cards are generated server-side with a signed payload, and only QR resolution to the live profile is authoritative — so an expired verification resolves to an expired profile. There is no way to freeze a favourable historical state, and we monitor for forged card images because someone will try.

Who gives BID the authority to verify?

Nobody. BID is **not a government authority — and never claims to be.**

What BID actually is

An independent private verification and trust platform that verifies information against sources it is lawfully permitted to use, and records exactly how.

SOURCES BID USES

- Official and authorized data sources where available
- Authorized verification providers and regulated intermediaries
- Licensed commercial verification providers
- Direct issuer and employer confirmations
- Entity-provided evidence, with consent

For every single verification, BID records:

WHAT was checked

SOURCE

METHOD

WHEN

RESULT

SCOPE

FRESHNESS

**“Don't trust the badge.
Verify the verification.”**

BID never says “this company is trustworthy”. It says: verified against source X, by method Y, on date Z, to scope S. The decision stays with the enterprise — and so does the defensible record.

WHAT TO SAY

Answer the question before it is asked, and answer it against yourself. “Nobody gives us authority. We are not a government body and we never imply it.” Then flip it into the strength: authority comes from transparency, not from a claim. Deliver the tagline slowly — it is the philosophical core of the company.

WHY IT MATTERS

Verification businesses die from overclaiming. An investor who has seen a competitor get into regulatory or defamation trouble will be listening hard for whether you understand the line. This slide proves you do, and it is also the ethical spine of the product.

“What is your liability if a verification is wrong and a customer relies on it?”

It is a genuine exposure and we manage it three ways. Architecturally: we report evidence with its source, method, timestamp and scope, never conclusions, so the customer's decision remains theirs and the record shows exactly what they relied on. Operationally: adverse findings are never auto-concluded — screening produces potential matches that require human disposition with a recorded reason. Commercially: bounded liability in contract plus professional indemnity cover. It is also on our open legal-items list — final terms need counsel before launch, and I would not want to give you a confident answer I cannot stand behind.

Trust without unnecessary disclosure.

Minimum necessary disclosure is an architectural principle, not a policy document. The buyer gets what they need to make and defend a decision — and nothing beyond it.

Incident response

Two things BID will never do: build a public or searchable database of individuals' background information, or sell personal data. The moat must never depend on either — that is both an ethical line and a commercial one.

WHAT TO SAY

Lead with the two before/after pairs — they make an abstract principle concrete in five seconds. Then use the DPDP dates. Most founders say “privacy regulation is a tailwind” vaguely; you have a notification date, two commencement dates and a penalty ceiling. That specificity is the credibility.

WHY IT MATTERS

Privacy is usually treated as a compliance cost. Here it is a moat: as obligations bite in May 2027, ad hoc verification via email and spreadsheets becomes an unacceptable practice, which pushes buyers toward governed platforms. That is a dated forcing function, not a hope.

“How do you handle privacy, really?”

Minimum necessary disclosure enforced at the authorization layer, not by policy. Every relationship carries a stated purpose, every disclosure beyond the public tier requires a specific, time-boxed, revocable consent artifact, and a person can see and dispute anything said about them. Our working position is that we are a processor for buyer-instructed verification and a fiduciary for the reusable profile — we build to the stricter reading, because dual-role compliance is expensive to retrofit and cheap to design in. The exact classification is on our legal open-items list.

“Doesn't the network model require sharing personal data across buyers?”

No, and this is a boundary we will not move. Business-entity data reuses across buyers under consent. A person's background result does not — it goes to the requesting employer under its stated purpose only, is never publicly resolvable, and is never reusable without fresh consent. That does constrain the network effect on the people side, and we plan on that basis rather than pretending otherwise.

Recurring platform, consumption, and services.

STARTER

₹9,999

/month, from

GROWTH

₹24,999

/month, from

BUSINESS

₹49,999

/month, from

ENTERPRISE

₹1,00,000

/month, from

LINE	STARTING PRICE	TYPE
1 · Enterprise SaaS subscription	from ₹9,999/mo	Recurring
2 · Business verification	from ₹499/check	Consumption
3 · Re-verification	from ₹499	Consumption
4 · Continuous monitoring	from ₹49/entity/mo	Recurring
5 · Candidate BGV	from ₹499/package	Consumption
6 · Employee verification	from ₹499/package	Consumption
7 · Contractor verification	from ₹199/worker	Consumption
8 · Enhanced due diligence	from ₹999	Consumption
9 · API usage	from ₹14,999/mo + usage	Recurring
10 · Enterprise integration	from ₹2,00,000	One-time

Illustrative starting prices. Final pricing depends on scope, provider costs, volume, SLA and enterprise requirements. These are not validated final market prices, and we do not publish a price list until provider quotations are in.

Target mix at maturity
~55% recurring · ~35% consumption · ~10% services
Services land accounts; they must never become the business. A services-heavy mix destroys the multiple and consumes the engineering team.

Illustrative unit economics	
Customer pays	₹999
Provider cost (assumed)	₹60
Internal + infra + support	₹58
Payment gateway	₹20
Gross contribution	₹861
Gross margin	~86%

All figures illustrative and assumption-based. No provider cost here reflects a real quotation.

WHAT TO SAY

Do not read ten lines. Say: three legs — recurring platform, consumption, services — targeting roughly 55/35/10. Then go straight to the caveat yourself. Then give the honest asymmetry: business verification runs at software margins; people verification runs at services margins because it is dominated by manual employer and institution checks. That distinction is the most useful thing on the slide.

WHY IT MATTERS

Sophisticated investors will test whether you know your own cost structure. Volunteering that BGV is a thin-margin line — and that you therefore treat it as an expansion motion rather than a wedge — buys more credibility than a uniformly rosy table.

“How do you make money, in one sentence?”

A platform subscription for the workflow, plus consumption per verification, plus recurring monitoring per entity — and the entity being verified never pays, because charging them would kill the network at its root.

“Are these margins real?”

They are modelled, not measured, and every provider cost in them is a placeholder. Our financial model is code driven by assumption files, and the single most important near-term commercial task is replacing placeholders with real quotations. Two lines already fall below our 70% target under those assumptions — standard BGV and per-worker contractor checks — and we know why: manual checks and a fixed roughly ₹48 per-verification overhead that crushes low-priced packages. We would rather show you that now than discover it after pricing is public.

One customer, eight expansion steps.

XYZ starts with a 10-vendor pilot. Expansion comes from more entities, more relationship types and more functions — never from renegotiating the subscription.

Different budgets, not a bigger one

Vendors sit with procurement. Workforce sits with operations and EHS. BGV sits with HR. Each expansion opens a new wallet inside the same account.

Monitoring is the retention line

A customer receiving useful alerts every month does not churn. Monitoring attach rate is our strongest predicted churn signal.

Same engine, new policy

Every one of these steps is configuration, not a new product. That is the commercial payoff of the domain-agnostic architecture.

Illustrative annual contribution for a single mid-market account. Not a forecast.

WHAT TO SAY

The headline number is the shape, not the total: a 10-vendor pilot can become a ₹1.5M account without a single renegotiation, because each step opens a different budget holder. Connect it back to slide 8 — this expansion is only cheap because the architecture is horizontal.

WHY IT MATTERS

Net revenue retention is what turns a modest ACV into a venture-scale business in enterprise software. This slide is the NRR argument, made concretely.

“What's your land-and-expand evidence?”

Right now it is a model, not evidence, and I will not dress it up. What we can commit to is the instrumentation: every pilot measures actual cost per verification and monitoring attach rate, and the first expansion we will prove is vendor into contractor workforce, because it sells to a different budget in the same building and nobody else serves it.

BID sits at the intersection of categories that are each already funded.

CATEGORY	PUBLISHED MARKET SIGNAL	SOURCE
Third-party risk management	2025 estimates ranged \$6.8B–\$9.3B ; CAGRs 14–18.5%	Multiple analyst firms
Background check software (global)	\$4.8B (2025) → \$10.1B (2033), ~9.9% CAGR	Grand View Research
Identity verification (India)	~ \$451–494M (2024) → ~ \$1.72B (2033), ~15–16% CAGR	UnivDatos
India company base	> 2 million active registered companies	MCA / Statista

We are deliberately not showing you a single TAM number

Analyst estimates for the third-party risk management market in 2026 alone range from roughly **\$6.5B to \$16.8B** depending on scope and methodology — a 2.5× spread. Quoting one of them as if it were fact would tell you more about our slide-making than our market. These figures are directional evidence that the categories are real and growing, nothing more.

Where BID sits

Not inside any one of these categories — across the workflow that currently spans all of them.

KYB · business identity checks

TPRM · vendor and third-party risk

BGV · people verification

Identity verification · individual identity

Compliance & monitoring · continuous assurance

The honest framing: BID does not create a new market. It unifies fragmented trust workflows that enterprises already pay for across several existing categories.

Sources: TPRM sizing per multiple analyst firms (Mordor Intelligence, DataM Intelligence, The Business Research Company, Research & Markets — estimates diverge materially); background check software per Grand View Research; India identity verification per UnivDatos; India active company count per MCA data as reported by Statista. Figures accessed August 2026 and not independently audited.

Specialists are deep. Nobody owns the layer between them.

Positioning is our assessment based on publicly available information as of August 2026; funding figures per Tracxn and press reports; Gartner MQ for Third-Party Risk Management Tools for Assurance Leaders published 6 April 2026. Not an endorsement by, or a partnership with, any company named. Independent validation recommended before external use.

WHAT TO SAY

Name the real players and be generous about them — investors already know these names and will trust you more for it. Two lines carry the slide. First: “The Indian specialists are our suppliers, not our competitors.” Second: “Our real incumbent is a spreadsheet.” Then place BID in the top-right and explain the axes rather than asserting the position.

WHY IT MATTERS

Decks that claim no competition get discounted immediately. This slide proves you have done the work, and it reframes the largest funded players as supply rather than threat.

“Why won't Google, or a large enterprise vendor, just build this?”

This is not a technology problem, it is a trust and relationship problem in a specific regulatory geography. It requires provider contracts in India with caching and reuse rights, buyer-side workflow depth in procurement and compliance, and a two-sided position where both the buyer and the verified party trust you with sensitive data. Large platforms are structurally poor at businesses that require being trusted by both sides of a transaction while monetising only one. The more realistic threat is a well-capitalised Indian KYB provider moving up-stack, and that is the one we actively plan against.

“What if a procurement suite adds real verification?”

Most likely outcome is we become their verification layer rather than their competitor. Their ROI on building Indian data-source depth and provider orchestration is poor if we are already embedded, and integration is our stated strategy — we are not trying to be Ariba.

What is an advantage today, and what compounds later.

Initial advantages — copyable

Real, useful, and not moats. We do not call these defensible.

- Domain agnostic
- Organization-centric
- Relationship-centric
- Configurable policies
- Provider neutral
- Evidence-backed
- Consent-driven
- Explainable assessment
- API-first
- Business + people

Compounding assets — the actual moat

- **Evidence history** — years of timestamped, sourced verification records a competitor cannot backfill
- **Reusable credentials** — entities that are already verified, under consent, with live validity
- **Enterprise integrations** — embedded in ERP, HRMS and procurement workflows
- **The verification graph** — entities, relationships, policies and credentials at density

HOW THE MOAT IS BUILT, IN ORDER

Stage 1 · Workflow + provider orchestration

Stage 2 · Policy engine + evidence history

Stage 3 · Reusable credentials

Stage 4 · Enterprise integrations

Stage 5 · Network effects

Stage 6 · Verification graph / trust infrastructure

Hard constraint: the moat must never depend on selling personal data or on a searchable database of people. Both are ruled out permanently — which removes an obvious monetisation path and is the correct trade.

WHAT TO SAY

Open by separating the two columns explicitly: “Ten things differentiate us today. None of them is a moat.” Investors hear feature lists called moats constantly; refusing to do it is a differentiator in itself. Then walk the six stages and be clear that stages 1 and 2 are where we are, and 5 and 6 are the thesis.

WHY IT MATTERS

It shows you can distinguish a head start from a defensible position — which is exactly the judgement an investor is underwriting when they back a seed-stage infrastructure company.

“So what is the moat, in one line?”

The accumulated graph of verified entities, their relationships, the evidence behind them and the enterprise workflows built on top — none of which a competitor can backfill, because evidence history is time-dependent and consent is not transferable. Today we do not have it. Stages 1 and 2 are what we are building now, and I would not ask you to underwrite stage 6 as if it already existed.

One wedge, built properly, before anything else.

WHAT TO SAY

The line that matters: “Everything in Phase 1 exists to make the last two boxes happen.” Then the discipline point — we are deliberately not building BGV, monitoring or the API on day one, even though customers will ask, because a shallow version of all four beats nothing and loses to a deep version of one.

WHY IT MATTERS

Seed investors underwrite sequencing judgement as much as vision. A founder who can name what they are refusing to build is more fundable than one whose roadmap is a wish list.

“What’s the first wedge, and why that one?”

Vendor and supplier onboarding. It has a named budget owner in procurement or compliance, a pain the buyer can quantify in days, no category education required because they already do the work manually — and critically, it is the only wedge that generates vendor invitations. BGV is a bigger market but it is price-driven, thinner-margin, and it does not seed the network. We enter BGV later, from inside an existing account, rather than competing on price from outside.

What could break this — and what we are doing about it.

RISK	WHY IT IS REAL	MITIGATION
Provider dependency	Our suppliers are also our most natural competitors, and pricing is outside our control.	Two qualified routes for every required check; automatic failover; per-call cost ledger; reuse rights negotiated in every contract from the first one.
Cold start	The network is worth nothing until dense; reuse only fires when two buyers want the same entity.	Product must win standalone for 12–18 months; regional and category density before breadth; anchor customers whose vendor base seeds the graph.
Vendor completion rate	If invited vendors do not finish, campaigns stall and the flywheel never starts.	Disproportionate investment in the vendor-side flow; assisted onboarding; regional languages; measured from campaign one against an >80%/7-day target.
Verification costs	Every margin number rests on unvalidated provider pricing.	Quotations before any public price list; pass-through clauses; no multi-year fixed consumption pricing.
Regulatory complexity	Credit information, financial data and identity channels are each restricted differently.	Counsel engaged pre-launch; product designed to degrade gracefully if any single source is unavailable; never assume access.
Enterprise sales cycles	Long cycles can outrun runway.	Mid-market first; paid pilots; land-small motion; annual prepay.
False positives	Name-matching on court and sanctions data is unreliable; a wrong finding harms a real business or person.	Potential-match framing only; mandatory human disposition; dispute workflow; dismissed matches remembered so the same false positive is not re-raised.
Data privacy & trust	A breach of background or relationship data would end the company.	Sensitive data segregated with independent keys; tenant isolation as the primary pen-test target; minimal retention; ISO 27001 and SOC 2 on the roadmap.

WHAT TO SAY

Do not soften these and do not rush. Say: “I'd rather you hear these from me than find them in diligence.” Then pick the two you genuinely lose sleep over — provider reuse rights and vendor completion rate — and go deeper on those than the slide does.

WHY IT MATTERS

Risk slides are usually theatre. A specific, quantified risk register with real mitigations signals operational maturity, and it front-runs the diligence process rather than being ambushed by it.

“Which of these actually worries you most?”

Two. First, provider caching and reuse rights — if we cannot contractually reuse results, the margin-expansion story disappears and we become a pass-through reseller. That is a commercial negotiation we must win early, from a position of low volume, which is the hardest time to win it. Second, vendor completion rate, because everything downstream depends on it and we have no data yet. Both are measurable within the next two quarters, which is exactly what this round funds.

Why now.

01

Third-party dependence is rising

Enterprises run on suppliers, contractors and outsourced workforces. Exposure grows with every tier.

02

Verification is still fragmented

Multiple agencies, APIs, spreadsheets and no system of record. The workflow layer is genuinely unowned.

03

API ecosystems have matured

Verification is now programmatic for entities authorized to use each channel — orchestration became possible.

04

AI improves the workflow

Document anomaly detection, extraction and analyst triage — used to flag and route, never to conclude.

05

Privacy regulation has a date on it

India's DPDP Rules were notified 14 Nov 2025. Consent-manager provisions commence 13 Nov 2026; substantive obligations 13 May 2027; penalties up to ₹250 crore. Ad hoc verification over email and spreadsheets becomes an untenable practice — **a dated forcing function, not a hope.**

06

Continuous risk is the new standard

Point-in-time verification is increasingly seen as insufficient by auditors and large customers.

07

Specialists stay specialised

The strongest players are deep in one check type. The layer between them is still open.

The window: the orchestration position is available for a few years, not many. It closes when a well-capitalised specialist moves up-stack or a global TPRM platform localises. Speed on the wedge and density in one region are the whole strategy.

DPDP Rules dates per PIB and legal commentary, accessed August 2026. Regulatory interpretation requires qualified counsel; no legal guarantees are made.

WHAT TO SAY

Spend your time on point 5 and skim the rest. Most “why now” slides are seven soft assertions; you have one hard date with a penalty attached. Say the dates aloud — 13 November 2026 and 13 May 2027 — because specificity is what makes a tailwind believable. Close on the window: this position is available for a few years, not many.

WHY IT MATTERS

“Why now” is where most seed decks are weakest. A dated regulatory forcing function plus a named closing window converts urgency from a sales tactic into an argument.

“Isn’t regulation just as likely to hurt you?”

It cuts both ways and we plan for both. It raises our compliance cost and constrains which data sources we can use — several channels are restricted and we design assuming we may not get access. But it raises the cost of the alternative far more: a company running background checks through email attachments and a shared drive is now carrying a risk it cannot govern. Regulation is a tailwind for governed platforms and a headwind for ad hoc practice, and we are firmly the former.

Become the easiest way for an organization to do seven things.

**Every business relationship begins
with one question:
Can I trust who I'm dealing with?**

BID is building the infrastructure to answer it.

bidtrust.in

Trust, backed by verification.

WHAT TO SAY

Read the seven quickly — they are a checklist, not an argument — then stop talking and let the closing question sit. Do not add anything after “BID is building the infrastructure to answer it.” The silence does more work than another sentence.

WHY IT MATTERS

The close should return to the exact sentence you opened with. An investor who remembers one thing should remember that question, attached to your company.

“What do you need from this round?”

Have this ready with specifics: amount, runway in months, and the three things the money buys. For BID those should be — real provider quotations with reuse rights secured, three paid pilots that prove vendor completion rate and true cost per verification, and the legal clarity on data-source access that determines what can be built. Name the milestones that unlock the next round, not a list of hires.

Hard questions.

The fifteen questions most likely to decide this investment — with the answers we actually believe, including where we are uncertain.

spreadsheet, and it wins most deals today.

orchestration layer is worth less to buyers because it will always route to itself. It is a head start, not a permanent barrier.

3 · What authority do you have to verify?
None, and we never claim any. We are a private platform. Authority comes from transparency — what was checked, from which source, by what method, when, to what scope, and how fresh.

4 · Why would an invited company join?
Their customer asked, and the alternative is a document pack over email. Reuse is the durable pull. Completion rate is the metric that proves it, and we have no data yet.

5 · Why would they ever pay?
They never pay to be verified. They pay when they switch sides and want to verify their own counterparties — a different budget, and a product they have already personally used.

6 · How do you avoid becoming a BGV company?
By never leading with BGV. It is price-driven, thin-margin and does not seed the network. We enter it from inside an existing vendor-verification account, on workflow and transparency rather than price.

7 · What is the moat, honestly?
Today, none — we have a head start. Over time: evidence history, reusable credentials, embedded integrations and the verification graph. We separate advantages from moats deliberately.

8 · What if reuse is contractually forbidden?
Then margin expansion disappears and we become a pass-through reseller. It is our single most important supplier term and we negotiate it from the first contract, not the tenth.

9 · Enterprise sales cycles will kill you.
Which is why we sell mid-market first, charge for pilots so they have an internal owner, land in one function, and expand into adjacent budgets rather than renegotiating.

10 · Are your margins real?
Modelled, not measured. Every provider cost is a placeholder. Two lines already fall below our 70% target under current assumptions and we can tell you exactly which and why.

11 · How do you handle false positives?
Screening produces potential matches, never conclusions. Human disposition is mandatory with a recorded reason, dismissed matches are remembered, and any entity can dispute a finding about itself.

12 · What is your liability if you get it wrong?
We report evidence with source, method, timestamp and scope — not conclusions — so the decision and the record stay with the customer. Plus bounded contractual liability and indemnity cover. Final terms need counsel.

13 · Doesn't the network need personal data to work?
No. Business data reuses under consent; a person's background result does not, ever. That genuinely limits network effects on the people side and we plan accordingly.

14 · How does this scale technically?
Event-driven and async by default, because issuer and human checks take days. Tenant isolation enforced in the data layer. The hard scaling problem is operations — exception handling and assisted onboarding — not compute.

15 · What kills this company?

16 · What would make you shut it down?
